The exhibition of the Church Crafts League is held in the Hall of Keble College, one of Butterfield's great successes. The very fine decorated roof, with the great range of windows below it, and the panelling and portalling, all make a fine setting for such exhibits. All these extremely interesting buildings of Keble have been erected since the last Congress was held at Oxford in 1862. This Hall was erected in 1868, and the renowned chapel dedicated in 1873. It is an excellent place for the proper display of the arts and crafts, and one regrets the Loan Exhibition could not also have been held here.

The League was founded in 1899 with the object of infusing new life into the building, decoration and the furnishing of the churches.

The Marston Chalice.

Its aim is to act as a medium of communication between the Church authority and the artist. Its object is excellent. Ruskin and Watts were early patrons, and it has always exerted a very great influence.

At once, on entering the Hall, the great tryptich at the far end arrests attention. It is intended for the high altar of St. Teilo's Church, Cardiff. It is not quite complete, but a good detail drawing hanging near it shows the finished design well. It is of English oak, the central panel with a figure of Our Lord with adoring angels on each side; the wings also contain low relief figures of angels also. The whole is splendidly gilded and coloured. It certainly should form an extremely striking figure at the east end of the church. The architect is Mr. J. Coates Carter, and it was made by Messrs. Boulton & Sons. Quite near is another fine reredos with its side screen. It is for Buckland Church, Berkshire, and is apparently designed to take its place below a great window. It is treated in a thoroughly English traditional manner, having just a row of niches with their figures extending its whole width. They are all richly gilded and coloured. The crowning, cresting and cornice are apparently in ebonised oak, and give a pleasing effect to the gilding and colouring below. Finely

Figure of St. George, in Oak.
By Mr. H. J. Youngman.

fully modelled and coloured. The grouping is excellent, and an unusual feature is the representing of the Shepherds as Youth. The fine models group extremely well.

A figure of St. George is placed centrally in the Hall. It is of old oak, and is treated with originality. The hiding of the body of the dragon in the block of the pedestal is a sane way of avoiding a great difficulty which the majority of sculptors fail over. The design and vigour of the figure are excellent, and the limitation of the material used is well recognised. The sculptor is Mr. Harold J. Youngman, and he is to be congratulated on the spirit of his work.

Two other important crafts need to be noticed—the very beautiful case of illuminated books and script produced by Mr. Graily Hewitt and his assistants, and the excellent woven fabrics of Mrs. Hazard. Mr. Graily Hewitt's principal exhibits are the three altar books—the Gospel book, the Epistle book, and the Service book; only the first is complete, and a very interesting volume it makes. The illuminated capitals are excellent, and the general script is admirable. These books were executed with the help of his assistants —M. Walker, F. Raymond and I. Hurstock.

The hand-weaving shown by Mrs. Hazard, of Harleston, Norfolk, is unusually fine. These examples of linen and flax and wool and flax and silk are very pleasing and satisfying, and are particularly beautiful for altar frontals and curtains. Drawings and photographs of architecture, fittings and memorials are also shown on screens in the hall.

It seems distressing that with such excellent work possible so much that is mean and poor should still be produced and given by unconscious donors to our fine cathedrals and churches; a very great deal of it is unworthy of them.

It should be possible to obtain the help of still a greater number of real craftsmen to augment this Exhibition. The opportunity is a great one, and must influence the clergy and laity. It is the only way to obtain an appreciation of beautiful things, and it is a pity full advantage is not taken of them by all the great craftsmen.

New Books.

Messrs. B. T. Batsford's list of autumn announcements includes: "Elements of Design and Form in Classic Architecture," by Mr. Arthur Stratton, and "The American Architecture Law Manual," by Mr. Clinton H. Blake, jun., author of "The Law of Architect, Owner, and Contractor," etc.

Free Library, Basford, Nottingham.

Two schemes for this library were submitted by Messrs. Ernest R. Sutton & Son, F. & A.R.I.B.A. in a competition arranged by the Nottingham Corporation in 1915, and were placed respectively first and second by the assessor, Mr. J. Alfred Gotch. Owing to the war the work was postponed. The Corporation has now decided to proceed with the erection of the library, but on a different site from that first selected.

Supervision, economy and convenience in working have been the keynote in the preparation of the scheme. The attendant in the lending library has a full view of all the book-cases, and commands the entrance and other rooms open to the public. The facings will be of red brick in 2½ in. courses and stone dressings. The roof will be covered with Bangor slates.

Free Library, Bulwell, Nottingham.

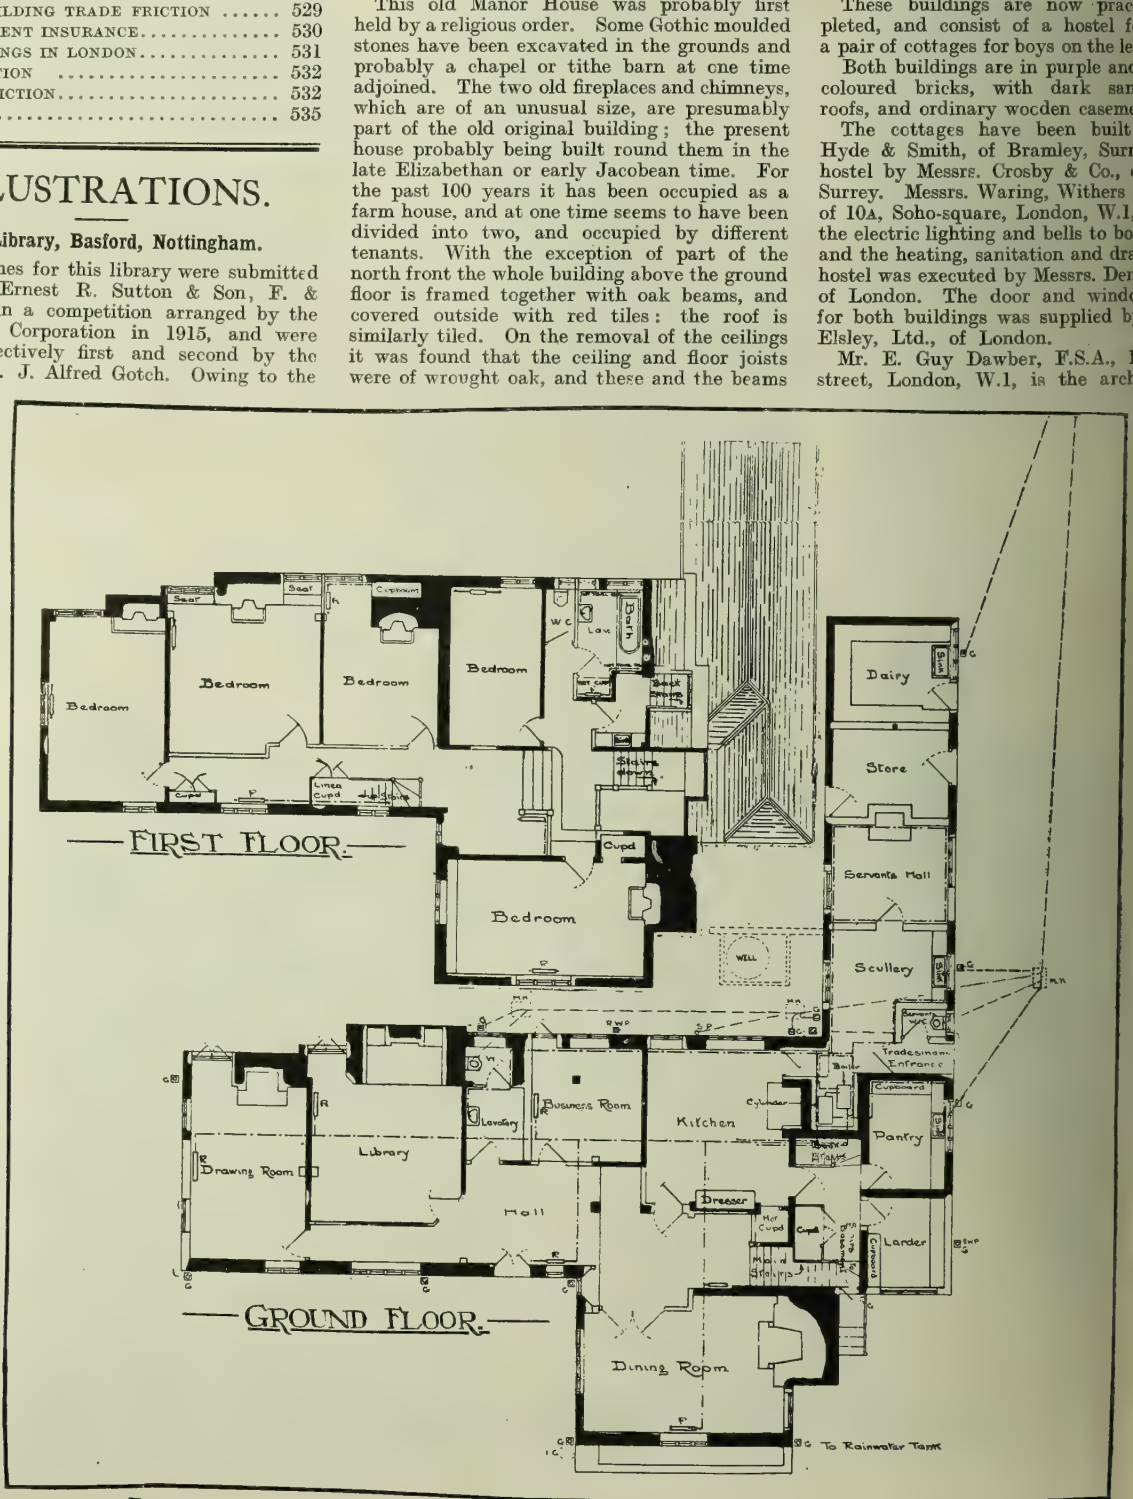
This scheme was submitted by Messrs. Ernest R. Sutton & Son, F. & A.R.I.B.A., in the competition arranged by the Corporation at the same time as the Basford Library.

Neatham Manor.

This old Manor House was probably first held by a religious order. Some Gothic moulded stones have been excavated in the grounds and probably a chapel or tithe barn at one time adjoined. The two old fireplaces and chimneys, which are of an unusual size, are presumably part of the old original building; the present house probably being built round them in the late Elizabethan or early Jacobean time. For the past 100 years it has been occupied as a farm house, and at one time seems to have been divided into two, and occupied by different tenants. With the exception of part of the north front the whole building above the ground floor is framed together with oak beams, and covered outside with red tiles: the roof is similarly tiled. On the removal of the ceilings it was found that the ceiling and floor joists were of wrought oak, and these and the beams and timbers in the walls and partitions ar all exposed to view.

This property, when acquired a few ago by Lieut.-Col. the Hon. Arthur Har Russell, was in a very dilapidated state he entrusted the task of restoring and bri it up to modern requirements to Mr. Mayell, J.P., Lic.R.I.B.A., Holland avenue, W.11. The work has now been pleted at a cost of over £8,000, by the foll contractors:—Messrs. Mills & Sons, Far general contractors; Tuke & Bell, Ltd., s system; Benham & Sons, Ltd., heating T. Hill, Farnham, electrical installation.

Neatham was before the Conquest he the Confessor, and at the time of the Doo survey by the Conqueror. King Stephen it to Waverley Abbey in 1147.



Lord Wandsworth Orphanage.

These buildings are now practically pleted, and consist of a hostel for girls a pair of cottages for boys on the left-hand

Both buildings are in purple and grey coloured bricks, with dark sand-faced roofs, and ordinary wooden casement win

The cottages have been built by M Hyde & Smith, of Bramley, Surrey, and hostel by Messrs. Crosby & Co., of Farn Surrey. Messrs. Waring, Withers & Chad of 10A, Soho-square, London, W.1, carrie the electric lighting and bells to both build and the heating, sanitation and drainage t hostel was executed by Messrs. Dent & He of London. The door and window furn for both buildings was supplied by Messr Elsley, Ltd., of London.

Mr. E. Guy Dawber, F.S.A., 18, Mad street, London, W.1, is the architect.

WESTMINSTER ABBEY RE-EXAMINED—VIII

By W. R. LETHABY.

FIRST AND SECOND WORKS OF HENRY III.

By the two works of the King I mean the building of the transepts, crossing, and the whole of the church to the east of these, including the Chapter House, in one effort; and then the extension towards the west in a second building period. Before the first work of the King was begun in 1245, a Lady Chapel had been built by the Abbots, and the foundation of this was laid in 1220 by the young King. The problems in connection with this chapel are well discussed by Mr. Westlake. I find it very difficult, however, to think that if, as is thought, this Lady Chapel occupied what is now the central area of the chapel of Henry VII, it could have been built in exactly this position before the work of 1245 was set out on the ground. The setting out of work was hardly ever accomplished accurately, and that the position, level, axis, and scale of plan of the old chapel should all have been perfectly suitable for incorporation in the new work seems to me next to impossible; and the junction in regard to heights must have been as difficult. The only material evidence for the exact situation of the chapel is a foundation which was found under the apsidal end of the main span of Henry VII's Chapel. On inquiring whether any memories were still held as to what was discovered, Mr. G. E. Wright (brother of the present Clerk of Works), tells me that he was present forty-eight years ago from last April, when the excavation for a grave was made. "In front of the Sheffield monument (in the N.E. chapel), when we took up the paving, we came on a stone wall nearly 3 ft. wide, 9 or 10 in. under it. They said it must have been the bottom of the wall of the early Lady Chapel. It was decided to try the other bay (the S.E. chapel), where we found the wall had been cleared away. I have no remembrance of bases or anything of that sort; the stones were roughly laid and rough axed, like the Norman work, and they came to the conclusion that the stones were of the Confessor's Church reused by Henry III. It showed that the old Lady Chapel had an octagon end, but there was not enough to give full width of the chapel." A sketch shows the wall between the two piers at the entry of the N.E. chapel. It would be easy to search this position again, but in the meantime it is not safe to assume that what was found was part of an apse of the old Lady Chapel. It might be a foundation wall of Henry VII's work, or part of a rebuilding by Henry III. A difficulty at once occurs as to the level, for the floor of Henry VII's Chapel is some 5 ft. above the level of Henry III's work and more still above the floor of the Confessor's Church. There is some evidence which suggests that the old Lady Chapel was rebuilt with the church, but until the foundation above described is re-examined and all possible evidence obtained, further argument is premature.

The great isolated Bell Tower, which stood on the north side of the nave seems to have been built before the work on the church was undertaken. The foundations were exposed when the new public buildings were recently erected, and I saw here a large number of piles which had covered a wide area. In the Virtue MSS. at the British Museum (23096) I have found the following note: "At Westminster, in the Sanctuary [the precincts], the Tower pulled down in 1750. In the foundation a stone found at the bottom, this date, thus, MCCXXIV. This stone building, called the Belfry, built before the present Abbey, refounded by King Henry III, but how much earlier unknown (I lately took the measures of it) was a castellated tower, square about 70 ft., and at one corner was great bells for the use of the Abbey Church."

It appears from the fabric rolls that a timber, lead-covered steeple was erected on the masonry tower while the first work of the church was in progress. An entry on the rolls for the fourth year of the works (1249) records a payment to *Magro Alex. ad pilos Be'fridi*—that is to Master Alexander, the carpenter, working on the spire of the Belfry. William and Roger, plumbers, were engaged on it in 1253.*

Two Works.—It used to be thought that the whole work of Henry III on the church extended only so far as the first bay to the west of the crossing, but Micklethwaite demonstrated that the building dedicated in 1269 included the Choir, which occupies a large part of the western limb of the church. There is evidence, moreover, to suggest that it had been intended to consecrate the eastern part of the church before the building of the Choir westwards was undertaken. On November 7, 1254, Henry III issued a mandate that funds should be provided "out of the money of the treasury or elsewhere to recall the workmen of the church of Westminster who have left as the King is informed" [a strike!] "so that the work may proceed, as the church consecrated at the latest on the Trans St. Edward, the quinzaine of Mich (Patent Rolls).

This proposed date would be October but, so far as we know, the King's inte not accomplished. Possibly the difficul too great, or the King determined in t time to take up the extension and c the whole together. In any case, it app the first work was so forward at the en that it seemed possible that it should cated in 1255.

It has been observed that the fabr 1253 shows that a special effort was that year. At one time no less than stone cutters were employed, and marblers, and parts were also being task or special agreement. Much finish was in hand. Lozenges for paving a tioned. 32 carpenters were employe time and 14 glaziers; plumbers and pain also engaged. Ade, the whitener, and were working steadily. The King w in France from August, 1253, to Janua and he doubtless intended that the glor fabric should be ready for consecratio Saint's day following his return. It be doubted that practically the whol first work including the transepts and House belongs to the period 1245–55 every detail must have been settled It is important to recognise that ev most characteristic of Westminster wa in the first half of the thirteenth cent

It was a great piece of work, but th with which it was done was not exc Viollet-le-Duc again and again calls atte

*In modern times it became confused with the Westminster Sanctuary or precinct in which it stood. In the transition time it was still known for what it was. In the Abbey records, a lease of tenements in the south part of the Great Belfry was entered in 1574. In 1578 the Sanctuary gate leading to King-street is mentioned, that is, the gateway to the Close. I may mention here that I find it ordered that "the Convent Kitchen, the Misericorde and St. Catherine's Chapel be taken down by the advice of the surveyor," in 1570. In 1575, tenements "where a chapel, late called St. Ermylles hill did stand," are mentioned, and in 1591 it was ordered "that the old Dorter and great room before be converted, one into a library, the other into a school."

Fig. 1.—Gable before Destruction.

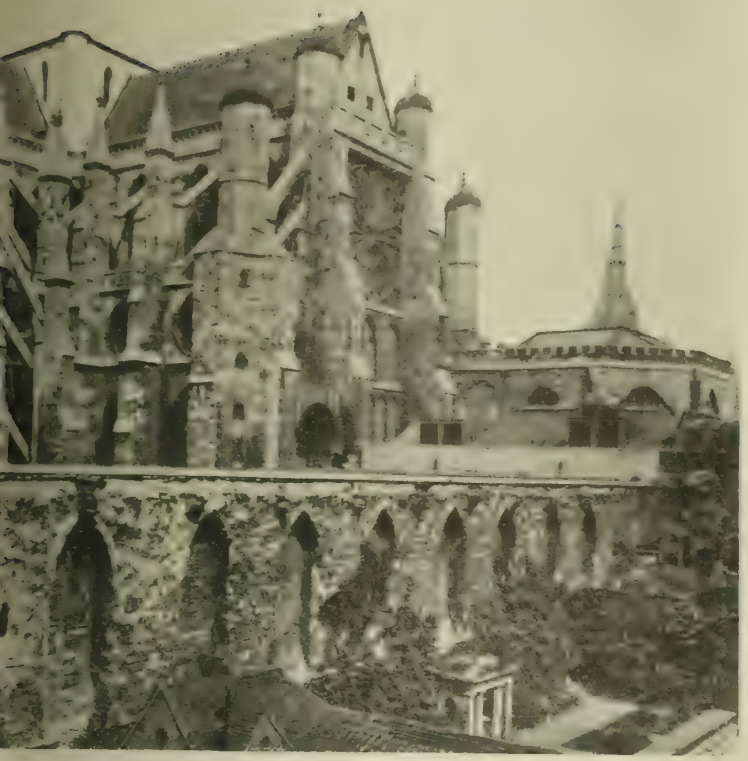

FIG. 2.—SOUTH TRANSEPT IN 1860.

ty with which immense works were rward in France. The character of , the records, and details of the agree in evidence that Westminster rmed to type in this respect. Yet we er at the co-ordinating ability which o much in so little time. Even the ered foundation required vast labour. walls stand on a great mass of con- ble wide enough for the projection of ses, it is some 10 ft. deep, 20 ft. wide and 30 ft. below.

e practical completion of the first was, the evidence suggests, a relaxa- t for several years during which other works were undertaken. On the f Prince Edward in 1254, the King aken to provide an establishment of ear, and money was hard to get. In King ordered that the roof of the el should be taken down and that it vaulted in stone—an order which mplies complete rebuilding. The s roofed about the same time and aving in the church were done. The e increasingly difficult politically and uilding can have been done in what Ramsay calls "the critical epoch time of confusion hard to follow." King issued an order that the monks v down the walls of the old church as estry by the King's seat, "so that it uilt as the work begun requires." must show an intention to resume t this was "the memorable year" rd Parliament when, as Matthew "Were never known so many folk ger."

John of Gloucester and Alexander, mason and carpenter of that date, l double wages when travelling to on for the church. This must mean aftsmen and materials for the work. year the mason died and it may be y of the second work above ground was done by him. This work can probably be assigned to the years 1260–1269. It is not more than a quarter as much as the first work, but the period includes that of the Barons' war. Money was still a difficulty and in 1267 the King had to pledge the golden images of the shrine for his immediate necessities.

There is a special freshness in the details of the new work, a subtle difference of spirit, and as will be shown below there are reasons which suggest that this new spirit was brought in by a master mason from the north.

Masons.

I discussed, in September, 1923, what is known about Master Henry (probably the same as Master Henry de Reyns), the King's master mason at Westminster from the commencement of the work in 1245. While admitting to the fullest degree study of French sources, all at Westminster seems to me so thoroughly re-thought and re-handled that I have no doubt that the foreign conceptions passed through the mind of an English master. On all the evidence known to me it appears most likely that Henry de Reyns had his name from Raines in Essex. The name Raynes is still not uncommon, and it is in a bookseller's catalogue before me. From what has been said of the progress of the works it appears that Master Henry had built the first work by 1254–5. It may have been his death about this time which put off its actual completion and consecration. I have now little doubt that a portrait head in the north transept is that of Master Henry.

(Master Radulphus de Dartford *cementarius* has also been mentioned, and I have found a note of another reference to him. He signed the document 17498 at the Abbey together with Odo the King's goldsmith, an important person of the earlier part of the King's reign. It really does look as if he might have been the master for the Lady Chapel begun in 1220, as suggested by Mr. Westlake.)

Master John of Gloucester succeeded Master Henry in the direction of the works about 1254–5.

FIG. 3.—TRIFORIUM (R. J. JOHNSON).

In 1255 he was exempted from serving on juries, and the Sheriff of Oxford was to permit this exemption. He was also granted "for his service to the King at Gloucester, Woodstock, Westminster, and elsewhere two robes with furs of good squirrels yearly for life from the Wardrobe, such as Knights of the household receive." In 1256 Master John, the King's mason, was granted the serjeantry Blechesdone. In 1257 he and Alexander the carpenter were appointed chief masters of all works of castles, &c., this side of Trent.

"Master John, the King's mason (*cementarius*), is named in a grant *c.* 1250 in the possession of the Corporation of Gloucester as holding land" (*Notes and Queries*, II, S. X). I doubt if Master John did much more than carry on at Westminster in an interim period. Records of other works exist. 1258, Dec. 1: The King commanded Master John, the King's mason, to cause to be repaired the chimney of the King's chambers in the Priory of Merton, and the Gardrobe and the King's Chancellor's chamber, and that the cost be charged to the King and allotted to the outgoings of the works at Westminster (Close Rolls, 42 Hen. III, Sharpe's Calendar).

The great mason died in 1260–1, and, as Mr. Westlake has shown, he died poor.

From the Calendar of Inquisitions (Misc. I, 298: Jan. 3, 50 H. III) it appears that "at the time of his death he was bound to the King in the sum of 80 marks by reason of arrears in the King's works. The debt was compounded for a yearly payment of five marks, but on inquisition being taken it was found that the income from his possessions was less than two marks a year." There was evidently trouble, and it looks as if the poor man was worried to death.

Master John was followed by Master Robert of Beverley, who brought Henry III's work to a conclusion. On the evidence of the fabric itself, which will be described later, I have come to think that all that is distinctive in the character of the second work must be ascribed to Master Robert. Although some of the changes in the Western extension of the Choir may have been intended from the first there are many alterations of detail. French influence is much less apparent, and there are no new direct borrowings in this part. This work is most sweet and beautiful. Fig. 5 shows an intentional variation in the piers east and west of the crossing, both of the first work.

In 1264 Master Robert is named as one of the wardens at Westminster receiving £100 for the works. The second work was thus proceeding at this time. The following year "Master Robert de Beverley, mason of the King's works of Westminster," was granted two robes a year from the Wardrobe, "so long as he be with the King in the said office in the same manner as Master John of Gloucester, sometime mason of the works, used to receive." In this year and the next he and Alexander the carpenter are called keepers of the works (Patent Rolls). His name appears in 1272 as witnessing a charter, together with Edmund the Goldsmith and William le Verrer, who must have been glazing the church. Robert of Beverley was still the King's master of works in 1284, he thus occupied the position for about 25 years. Probably work of his could be identified at the Tower. He was a very great mason.

The best approximation to an English architect's drawing known to me is one of tabernacle work surrounding a figure of Becket in the "Black Book of the Exchequer" (Fig. 4). It is so like the work of Villars de Honnecourt that it must be very similar to the original drawings for the Abbey. In the sixteenth century a house outside the north side of the nave was still called "Mason's Lodge."

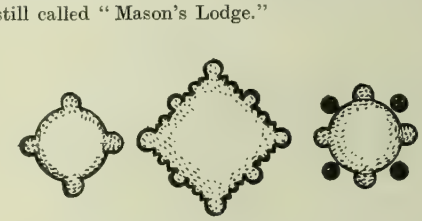

FIG. 5.—PLANS OF PIERS.

ORIGINS.—When I considered the question of sources of design before, I concluded that Reims Cathedral was the chief prototype. Now I would substitute Amiens. The principal borrowings from Reims were the apsidal chapels with their pair light windows and wall passage. The *planning* of the apse with the surrounding chapels was, however, founded on a study of more recent developments at Amiens. The setting out of the apse at Westminster is well analysed in "Gleanings." The centre of the radiating system is half a bay to the east of the last normal bay (Fig. 6). This gives a slight drawing in of the bay next the normal one, making thus an easy transition to the fully canted bays of the apse. The system of setting-out the *apse* (not considering the chapels), is similar to that followed at Beauvais Cathedral (V.-le-Duc, Vol. 7, p. 551), and also I believe at Amiens. Viollet-le-Duc proposed another

THAMES VALLEY REGIONAL SURVEY

ecessity is now widely recognised for ete and thorough survey of a region mmencing the actual work of regional . and Messrs. Adams & Thompson, in iminary report, have wisely summarised ing facts and statistics relating to the Valley, leaving for later consideration posals for dealing with the region and r development.

sex and the Thames Valley are an part of London, and it is obvious that l survey of any part of the Greater rea must also have regard to the needs of London as a whole. It is te that Kingston and Hampton have their way to join with the ten local s included in the region, and it is hat the omission of these two authori- especially of the borough of Kingston, usly affect the usefulness of the work gional Committee.

ealing with the historical development ortion of the Thames Valley and its eauty and characteristics, in which particulars are given as to the origin h of the numerous Royal parks in the ne gradual growth of the region is a place of residence and recreation, for the middle classes. The wide- eposit of river gravel overlying the lay provides an excellent subsoil, and uch to do with the general healthiness ames Valley as a place of residence ; ne authors point out, there are many ere the gravel has been, or is being , to the general deterioration of the e neighbourhood. Very unsightly avation works come in for very proper tion, and it is all-important that the orities having the guardianship of the de should be alive to this very real the amenities of their district.

verside towpath between Hampton Hampton Court is at present very lected—neither Thames Conservancy authority accept responsibility—and e all places, the opportunity exists for finest riverside drives in the county. mple expedient of removing the fence oining Home Park, some miles of river ould be thrown open to the park and leasure ground secured with little or e to the nation. This is not touched he present report, and no mention is ne need for further river bridges across es. At Chiswick, at Richmond, and gton, new road bridges are badly nd it is to be regretted that this y report does not at least hint as to the for these. Useful statistics as to the n of population and the housing in the region are given, and it is to learn, on the authority of Mr. Secretary to the Middlesex Education e, that the gross cost of educating average attendance at the schools in y is £13 2s. per head, of which, speaking, 50 per cent. is defrayed by nment Grant, leaving a net cost of child to be met out of local rates. is that a house rented at £30 per d producing, say, £15 per annum in if all the rates went towards educa- d only yield sufficient revenue for the of two children per house. All other nses have to be met out of the rates ty of a higher rental value. The growth of small house property is to be a source of impoverishment to ather than the reverse, and a serious or the rating authorities will arise in

pping centres of this portion of the alley are principally Richmond, with nd Kingston with 2.3 shops per 100 ulation. Approximately 30 per cent. rking population of the whole region ved in London and an average of only t. are employed locally.

The Survey of the Industries shows that at present the Thames Valley District is comparatively free from factories, although how long this will continue is difficult to say. The riverside, where not already occupied by towing-path or dwelling-houses and gardens, does not afford many sites in close touch with rail communication, but it is rather remarkable that even in such districts as Chiswick and Barnes the distance from railways and docks has so far prevented the springing-up of any considerable number of factories.

On the subject of communications by road and rail, it is obviously difficult to deal with a small sector of the London area without reference to the rest, but the report gives in diagram form an interesting analysis of the relative volume of traffic on the principal roads. Railway time zones in an area such as this would not at first sight appear to yield much information, but when it is realised that it takes upwards of an hour to reach some districts not much more than 12 miles from London, it will be agreed that there is considerable room for improvement. The large open spaces and parks of the Thames Valley have long made this fortunate part one of the playgrounds of Greater London, and we hope that it will be many years before this character is changed.

ENGLISH PRIMITIVES

This name appears so to have established itself as the designation of a period of work which is often anything but primitive in any right understanding of the nature of art, that we have to accept it. We may instance, however, the case of the mural paintings at Eton, which are in the grace of the figures, the treatment of draperies, and the general accomplishment of the work, far from being so. In an account published by Mr. Humphrey Milford of his lecture at the British Academy on Mediæval English mural painting, Dr. Tancred Boronius deals with a subject of great interest, which has not had the attention bestowed on it that the importance of the subject claims. The writer affords us some occasional glimpses into the history of some of the paintings actually preserved to us, and tells us how a wall painting in St. Anselm's Chapel, Canterbury Cathedral, executed in the twelfth century, not long after its completion, had a wall built in front of it, thus remaining invisible for seven hundred years. "It was in this fashion," so he tells us, "protected against a fire which is known to have broken out in 1174, and when re-discovered some thirty years ago, emerged in a remarkably intact condition with the colours very fresh and vivid." The Byzantine influence is clearly discernible in this painting, which is a good example of that assimilation to which the twelfth-century English artist was directed.

The account of the evolution of subject matter, which took a new direction and which extended beyond more purely doctrinal representation in the fourteenth century, is to be regarded as an early impulse towards more democratic expression which the arts received at this time, through the influence of William Langland. There is actually an instance (at Broughton, Bucks) of Christ as Piers Plowman, appearing on horseback as a pendant to the figure of St. George. Geographically, so we are told, paintings of Christ as Piers Plowman cover an extensive area. Dr. Boronius gives an illuminating account of the artistic relations between England and Scandinavia in the thirteenth century. In 1248, Mathew Paris, monk of St. Albans, distinguished both in literature and art, was sent on visits to the Abbots and Convents of the Benedictine Order in Norway; and there is an oak panel painting, a wing of a retable in the church of Faaberg, which bears near resemblance to certain illuminations of the school of St. Albans. One among them may with some probability be assigned to Mathew Paris himself. As the writer states, "What would be more natural than to connect this panel with Mathew Paris's visit to Norway?" In any case, the coincidence is not without interest.

There is much else in the lecture which throws light on the history of English mediæval painting which has not received much systematic inquiry so far. Such fragments as have come down to us are in a very perished state or have suffered from restoration and defacement, but distributed throughout the country our churches still reveal the record of an art much practised in the England of that time. Much of it bears traces of merely local origin and is of rude and primitive character; but seldom without evidence of a certain power of design and dignity in the forms portrayed. Very free from over nicety or conscious theory these mural decorations are executed in a very direct way, seldom with much preparation of surface beforehand. In a good many instances, as in the paintings in the Chapter House of Westminster, a gesso-plaster ground seems to have been laid over the stone, probably the best possible surface for painting, and for security that could be invented.

We are not inclined to over-estimate the importance to ourselves of this ancient work which has passed with its time, and has not very much with which to address us now. We dwell too insistently on the past when we allow it to obscure our judgment in regard to present work. It is so much easier to be eloquent about painting which comes down to us with the halo that time sets round the twilight of the past. We may not live in this and it behoves us to greet with equal tolerance and understanding what our own time projects. Encouragement such as this is much more difficult, appreciation more rare because it asks so much more from us. The connoisseur of to-day who prides himself on buying nothing but old masters, detaches himself from the appreciation of what his own time holds for him, and we need to discountenance the assumptions of culture that often go along with it.

Dr. Boronius endorses a plea which has recently been made that a Corpus be formed of reproductions after the existing mediæval wall paintings scattered all over England. Such a publication would be of much value, as the excellent copies by Mr. E. W. Tristram go to prove; but we should, in such a case, beware of a provincial sort of patriotism usurping the place of fact as in the case of the attribution of the Eton wall paintings, manifestly of Flemish origin, to William Baker, an Englishman.

PROPOSED HOUSE AT LONG ISLAND, NEW YORK

The plans shown by the drawings on p. 517 are the first which have been prepared, and are still under consideration. The idea is for a moderate size house of Tudor character, planned in accordance with American custom for easy working. the sun parlour, with balcony over, being the special feature of the scheme. The chimneys would be of red brick with dark headers, and all walls finished in white cement. Electric radiators to be used in the drawing and dining-rooms, or gas fires if desired, but in either fireplace, if preferred, coal can be used. The passage to fuel store, &c., would be covered over.

A small guest's bedroom is built out over the hall below. Adjoining this is a linen room with hot-water cylinder, and bathroom with fitted lavatory basin, and w.c., the bath to have shower attachment with plate glass enclosure, and the room to be lined with Vitrolite in black and white. A lavatory basin would be fitted to each bedroom. Messrs. Smee & Houchin, of 82–85, Fleet-street, E.C., are the architects.

Old Westminster.

A lecture on "Old Westminster" will be delivered by Mr. Herbert A. Cox on October 6, in the Large Hall of the Institute. The lecture will commence at 7 p.m., and will be illustrated by lantern slides and a model to scale. Members of the public will be admitted on presentation of visiting card.

THE PENTALPHA METHOD OF DESCRIBING THE GREEK IONIC VOLUTE

By JOHN HALL, F.R.I.B.A.

THE accompanying diagrams are taken from a French book—no author's name—on Grecian Architecture of 1808 date, and the following is a description of the method of their construction.

Upon an axis A B C D describe the eye of the Volute equal to 3 parts and 1-3rd of a module. Through the centre of the circle draw an extended diagonal at an angle of 45 degrees E.F. With a radius of half the diameter of the eye describe from A as centre an arc at G; repeat this operation from C as centre, thus completing the arcs at G.

The method of constructing the pentagon, though of vital importance, is unfortunately not shown in the book of reference, yet after several attempts, however, I eventually discovered a solution of the problem which is as follows:—

From the axis G draw with a set-square a line 60 degrees to the vertical plane; produce this line until it cuts the lower part of the circle at H. From H, with a set-square, draw a line 45 degrees to the vertical plane, produced until it cuts the circle at I. Thus H I will represent one side of the pentagon. To complete the pentagon mark off upon the periphery of the circle the remaining distances, each of which must be equal to the side of the pentagon already evolved.

The next operation is to fill in the two figures, each having five points, the larger of which is shown in solid black line. With a set-square draw a line at 45 degrees to the horizontal plane, joining J L. From J draw a line joining it with H. Join I to L, then from K draw lines joining it to H and I respectively, thus completing the figure known as a five-pointed star. The five-pointed figure, shown in dotted line, is formed by first finding the centres of each side of the pentagon; then, with a set-square at 45 degrees to the horizon, join M and P. Join M to O and O to Q. Then from N join to P and Q respectively, thus completing the smaller five-pointed star.

Although the method of finding the various centres from which the volute is described is not explained in the book of reference, yet it will be seen in the accompanying drawing that they are arranged clockwise, and numbered 1, 2, 3, 4, &c., as on the original diagram. The line 3, 5, 8, drawn at 45 degrees to the horizon, is found by striking arcs from centre 10 as radius, while the centre 6 is found by striking stilted curves from centres 9 and * respectively. Before drawing the volute it will first be necessary to construct quadrants forming sections upon which the spiral is constructed. Thus by producing line I K we have the first section; by producing line K H, we have the second section; then, by producing a line from centre 3 passing through point X on the horizontal axis, we have the third quadrant. The remaining quadrants are found by producing lines H J; M O; N P; L I; and Q N.

To draw the Volute it will be necessary to set off a distance upon the vertical axis equal to three times the diameter of the eye, R. Then with centre I describe the first section, followed by using centre 2 for the second section of the volute. By using the remaining centres 3, 4, 5, 6, 7, 8, 9 and 10 in succession, the outer spiral of the volute will be finally completed.

To describe the inner spiral, or fillet, of the volute, mark off at R a distance equal to 1-3rd of the diameter of the eye. To find the centres of the inner spiral divide the width of the fillet, already determined, into eight parts, one of which will give us the distance of the new centres in relation to that of the old. With this $\frac{1}{8}$ part mark off the new centres, in every case below the original centres, thus being always $\frac{1}{8}$ part removed further from the arc already drawn. From these new centres proceed to describe the inner spiral in the usual way, as already stated.

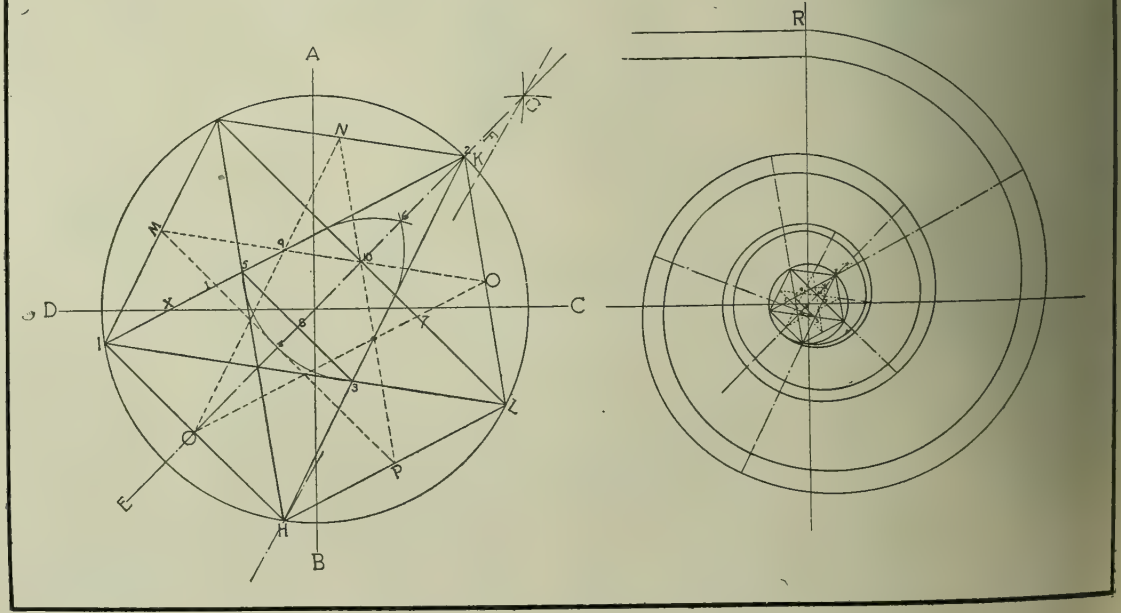
I may say that the description accompanying the diagram in the book of reference is very meagre, as for example, instructions are given for finding only three of the quadrants. But by using the additional number of quadrants a better result is obtained. May I add that this diagram may prove useful as demonstrating a geometrical method of drawing a regular pentagon within a circle of any size.

The figures of the five-pointed stars will probably be of interest to members of all Craft Lodges. But particularly will the pentagon figure appeal to members of operative Masonic Lodges. Apparently these two figures, and probably the method of setting them out, was known to the early Egyptians. It will also be noticed that in addition to the outer pentagon, there are also within that figure, around its centre, two other regular pentagons, each having a different area.

CIVIL ENGINEERING*

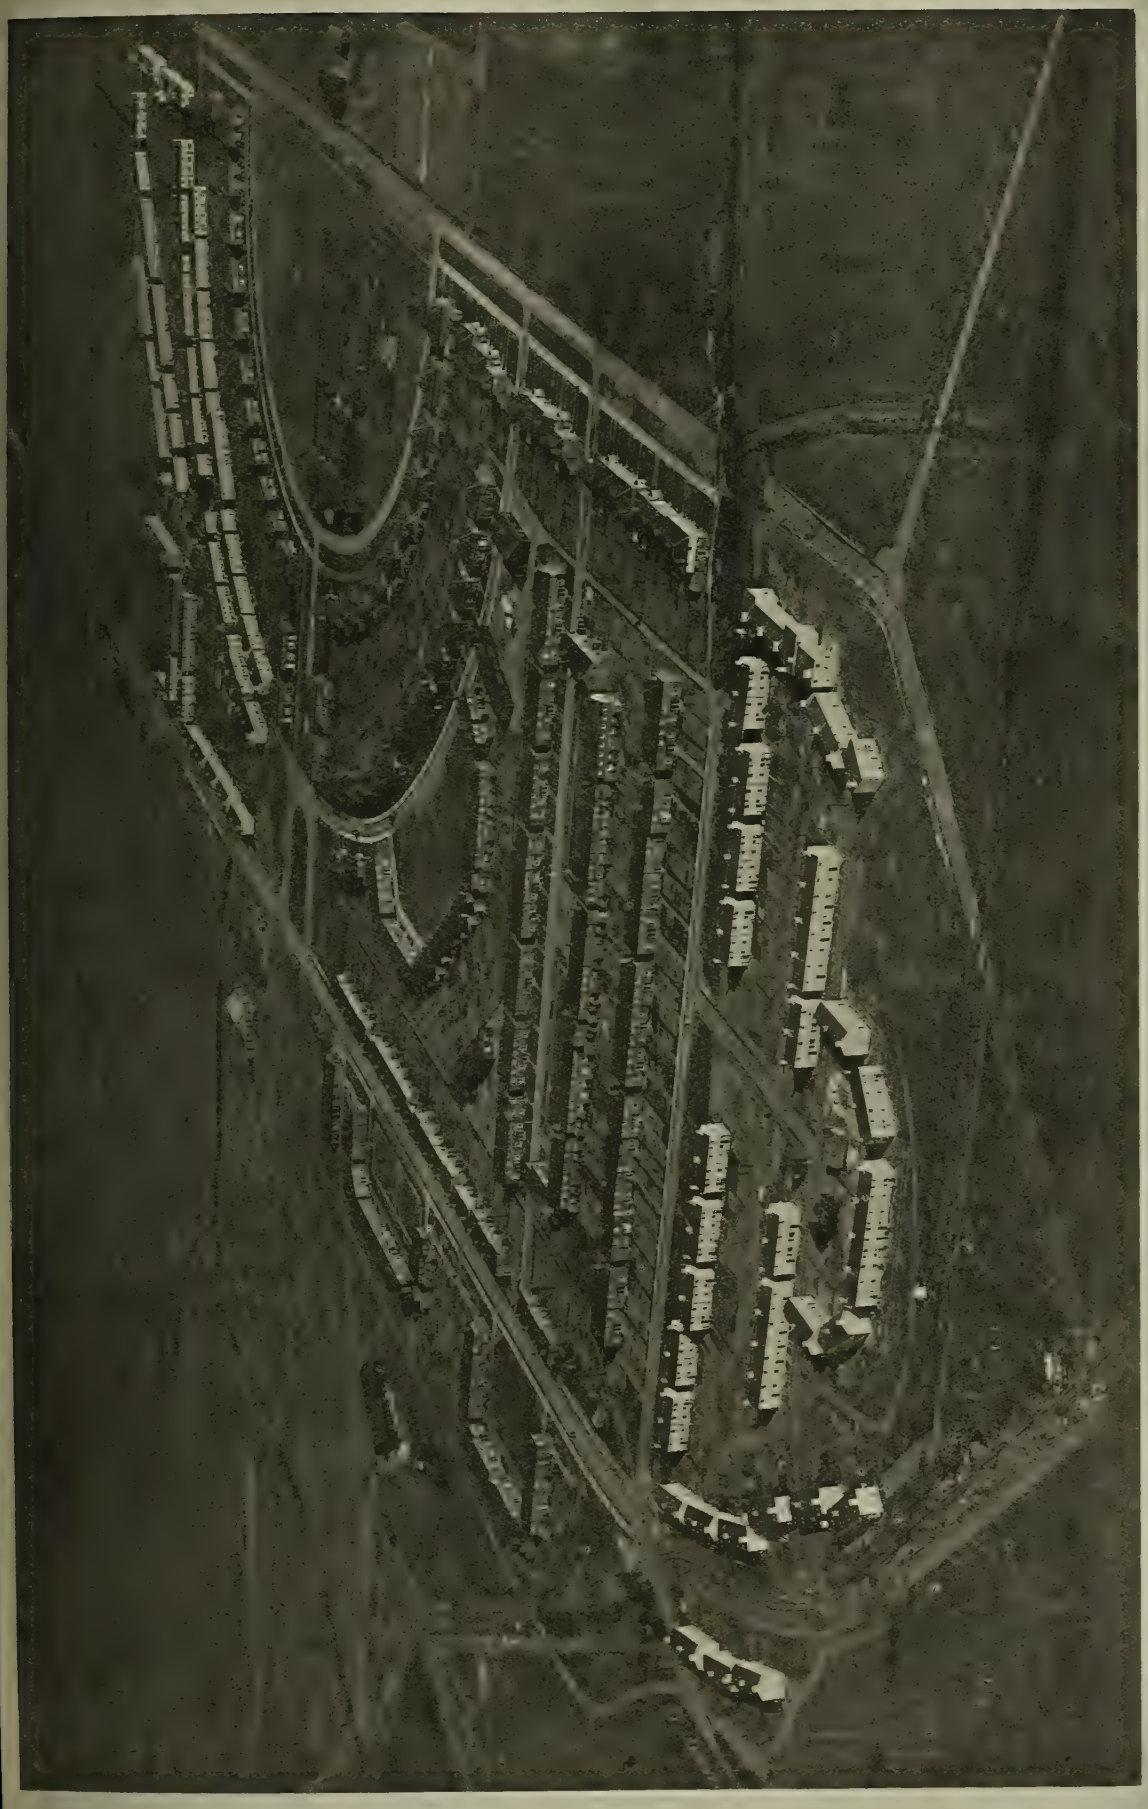
THE author has covered in a general way most civil engineering operations and requirements. While essentially a book of engineering common-places and free from mathematics, the explanations of various methods of const and uses of material should prove usefu junior assistant engineer.

Specifications form a useful part section, it being necessary to avoid, as possible, variations of a scheme causing and omissions. In construction of works works often cause trouble, due to the character of the ground and inability t mine correctly what may be met with du progress of the work. The chapter on works and foundations provides information. The well-known pile for P= Wh/8d—is given, but must be tak guide and not as a general rule. No formula can be given. Many engineers p use test piles instead of the results of when fixing value of ground to carry loa



Surprises occur no matter what me adopted.

In a particular case trial borings had bee in connection with the erection of a pier ing into the sea: screw piles were driver 25 ft. below ground level, inclusive of abo into the chalk. During the application of tons dead weight test load to which each pile of every bay was subjected, at a poin 200 ft. from the shore, the pile sudden 20 ft. vertically. Subsequent invest showed a cavity in the chalk. While it that strength and durability, as mention the chief considerations governing the stones used by the engineer, porosit weathering qualities are frequently of co able importance, particularly under certa ditions. Thus, porous stones are liable integrate as a result of frost following period.



The most satisfactory means of ascer the properties of a stone are by actua this takes time and is costly. Reliable can be obtained by a petrological exami where sections of the stone are prepar the resulting slides examined under a scope. The apparatus required is sim expensive, and by no means difficult to A decomposed constituent can be dete this way. In this connection concrete, the aggregate is dry granite containing posed felspar, would be liable to serio traction. In metals, probably the most impurities are phosphor and sulphur; t producing cold shortness and the secc shortness or brittleness when hot.

We notice on page 98 that three wor a displaced letter due to a printer's erro may also account for Unwin's rule f diameter being given on page 165 as instead of $1.2\sqrt{t}$.

* AN INTRODUCTION TO THE PRACTICE OF CIVIL ENGINEERING. By E. E. Mann. (Macmillan & Co.) Price 7s. 6d.

The Pentalpha Method of Describing the Greek Ionic Volute.

Bird's-Eye View of Dormanstown. (See p. 524.)

MODERNISM IN ARCHITECTURE

At a meeting of the Birmingham Architectural Association some time back Mr. Howard Robertson said the subject of "Modernism in Architecture" had appealed to him for two reasons. The more important reason was that he believed that the present epoch marked a cleavage between two schools of thought in architectural design—which for lack of better definition he would term the "old" and the "new"—and the second reason, arising out of the first, was that he was particularly anxious, as one concerned in architectural education, to provoke discussion on the wisdom, or otherwise, of departure from certain traditions which the majority of architects were following at the present time.

It was an open question whether or not architecture of the present day was an expression of the real convictions of the designer, and whether the majority of architects were creative artists in the sense of evolving buildings which had beauty derived from an ennobling function, and not beauty in the form of an applied garment which was incompletely convincing owing to its unsuitability and frequent hindrance of function, independently of any question of plagiarism or pastiche.

In his opinion there existed a majority of architects who were designing in accordance with their ideals; but he believed those ideals were not innate but had been formed through the influences of poorly directed education, social snobbery, and mental inertia, assisted by the pressure of modern conditions. The remaining minority of architects appeared to be divided into the class which was attempting without ideals to live by supplying the article for which it assumed a demand, and the class which was thinking and acting with independence, receiving some support but innumerable rebuffs.

The trouble at present was that architects were failing to benefit by the heritage of tradition, and failing to add to it, possibly because its grandeur had intimidated them, and also because they had depended upon it instead of attempting by original thought to make tradition themselves. They had overlooked the great essentials of architectural composition; they had not seriously attempted to analyse or formulate them, and they had steadily piled up an immense accumulation of data regarding architectural features and details which they had allowed completely to dominate them. Curious and charming ornament arising perhaps from the naïveté of its designers, all the happy accidents and interesting conceits which were killed by repetition and copyism, were habitually thrown on the architect's screen, and in a voice charged with emotion students were adjured to sketch and measure! Sketch and measure by all means, but not to make a magpie's hoard! Not to be satisfied with a gloating over details, but to understand principles, proportion, scale, fitness, to analyse beauty, so as to be fitted to attempt it in buildings in which none of the detail motifs which they had plotted might be appropriate. Blind worship of the past, vague allusiveness regarding great buildings whose claims to greatness were seldom logically explained, the idea that no architect could originate until he had been through a period of undigested pseudo-antique or mediævalism, the dictates of fashion, all constituted so many hindrances to the production of a living architecture which aimed at the most beautiful possible combination of function and expression, suitable to and adorning the period in which they lived. The classic vocabulary which they had acquired and utilised in most of their architecture to-day was extremely flexible. It provided good or mediocre solutions for nearly every problem, solutions decent if not inspiring, and its motifs were capable of being handled with comparative freshness by an able designer. But in the deceptively easy manipulation of classic form lay the great danger. They had been vulgarised and misused through this very quality, and the rival glories and grandeurs of Greece and Rome had been butchered and cast into the gutter together. The traditional architecture of antiquity, so satisfying in many of its forms, instead of being reserved for those buildings whose civic purpose was traditional, and where a traditional treatment was therefore expressive, had been utilised as the universal cornucopia. Its output had now produced saturation, the not unlimited vocabulary was being exhausted, stagnation was setting in, and there were signs of reaction and revolt against its domination. Such a revolt was an inevitable and healthy sign of vitality and an evidence of independent thought. As long as any definite style or type of architecture was sufficiently flexible and suitable it would satisfy, provided that a desire to design in that style was really spontaneous on the part of the architect. As soon, however, as they found the combination of inadequacy to express function with beauty, and decadent vulgarisation and style dominating conception, the desire was aroused to create new forms more beautiful, more expressive, in which externals and mannerism were thrown overboard in favour of a reversion to main principles which in the process of decay had become submerged. As soon as a style became a manner, into which, to quote Mr. Roger Fry, the architect translated, and in which he no longer lived, that style was dead.

Such a situation was, he believed, being reached to-day. Architecture was generally decadent; they had only to look at the largest and most recent achievements of some of the foremost architects to realise it, and the time had come for an examination of the means for remedial action.

To achieve progress they must eliminate prejudice against experiment; they must study, and try to benefit by, the attempts of architects in other countries to design and not copy; they must broaden their outlook on the students' training, and they must remove all external hindrance from architectural progress as far as lay in their power. The heavy hand of so-called "scholarship," with its excessive cult of Greece and Rome, a competition system which offered the premium to any plan that was simple and cheap and which almost completely disregarded architecture, and a general attitude on the part of architects and their patrons of sluggish repression towards the so-called "modern"—all these must be overcome.

That it should be practically indispensable for an architectural student to utilise the recognised forms of classical or Renaissance architecture in order to win the biggest architectural prizes of the profession was as unfortunate as was the insistence of a City Corporation that its new buildings should embody the orders. As regarded competition architecture, the encouragement to beauty of design was very slight. The fashionable dictum seemed to be that the best plan was always the simplest, a very dangerous half-truth, as the simplest-looking plan in a set of designs might be the very worst in the collection. Competitions seemed to be judged entirely on apparent simplicity of plan (which should preferably be completely symmetrical), and pitiable elevations did not seem to weigh against the selection of such schemes. It was safe to say that at the present time a design such as that of the new town hall in Stockholm would have had practically no chance of being premiated in this country.

Bartlett School of Architecture.

The following election has been made at University College, London: To the Bartlett Entrance Exhibition, tenable in the School of Architecture, of the value of £40 a year for five years—Mr. W. F. B. Lovett, of the Dunstable Grammar School.

THE ROMANCE OF MIDDLE AGES

Sir Banister Fletcher recently g introductory lecture of a course of twe University Extension Lectures on M Architecture, at the Central School and Crafts, Southampton-row.

He dealt first with the nature of the to be given under the auspices of the Un of London during the coming sessio explained that he would deal with the architectural history on broad lines popular point of view and trace its ev in the different countries of Europ referred to architecture as a visible ex of civilisation uniting and embracing th arts, and pointed out that all modern was founded upon old art, although ada order to conform to existing conditions. tecture being the basis of all design, a ledge of it was necessary not only to d and art students, but practically the community. The author and novelist, settings of their historical novels, the jo and the photographer, who largely dea buildings, the connoisseur of the accesso and the teaching profession, all required ledge of this essential and enthralling All who travelled required a knowledge subject, since the lands they visited a closed book without that knowledge. over, the architectural work of the pres was stimulated and refined by a right s the best work of the past.

Sir Banister illustrated his lecture with slides, and showed that mediæval archi was a continuous evolution from the arched or Romanesque period to the p arch or Gothic period, and was the re forces and tendencies underlying the life of mediæval times. Views were comparing the architecture of the periods of history, so as to form a con link with the other courses of lecture Banister hoped to introduce the atmosp the mediæval period and form a sense of tion between architecture and history, formed the stage upon which it had enacted.

The next lecture will deal with a mediæval cathedral.

STEEL FRAME BUILDI

Anyone looking through the pages brochure recently issued by Messrs. D Long & Co. would, we think, be much im by the variety and extent of steelwork out by this well-known firm all over the The advantages of steel-framed buildi apparent enough, and if the construction of the buildings could be made clear the would be happy enough. It is not appar however, how we are going to fit our the idealities into practical works, and w realise from the pages of a striking b like this from Messrs. Dorman-Long t value and efficiency of steel-framed b will for long to come triumph over ar forms of construction we yet know of f mercial purposes.

It is satisfactory to see that we hav country a firm so well equipped for carr steelwork in such a variety of forms sort of place and conditions. The p. 523 shows the admirable housing they have so far carried out, which is ing illustrations of their enterpris readers will have noticed that their E stand at Wembley was designed by Si Lutyens.

The Hackney Institute.

The prospectus of the Hackney Inst 1924–5 has recently been issued. The tural and building trades department courses in architecture, building con carpentry, and joinery, woodworking m work, plumbing, and painters' and d work.

OOK REVIEWS

d Years of Portland Cement. By Davis, M.Inst.C.E.I., M.I.Mech.E., xxii + 282 pp.; 41 illus. (London: te Publications, Ltd.) Price, cloth g, 21s.; leather, 25s.

lume has been specially written to entenary of the invention of Portland 1824. In addition to a complete the growth of the cement industry arly days until it has arrived at its sition as one of the most important n the world, a mass of information the different methods of manufacture e period under review. The value sumer of the improved methods of re in modern cement works is shown t that whereas in 1852 the tensile f the neat Portland cement on the s only 100 lbs. tensile per sq. in. at , present-day cement has a strength per sq. in. at the same period. The so often made that Joseph Aspdin, er of Leeds, was the inventor of ement, as we know it to-day, is not y the author, whose researches have the conclusion that Aspdin was the the name "Portland cement" only, similar cements were made earlier te of Aspdin's patent (1824) by Vicat nd Frost in England.

me contains a summary of the Port- t specifications of the world, and a of information which should be of l architects, engineers, and builders n interest in the materials they use, chemists and geologists. An appen- n full the early patent specifications d cement by Higgins, Parker, Frost, Ransome, Stokes, Hurry and Aspdin. e is well bound, and has been produced tive manner suitable to the important mmemorates.

Cottage Construction. By H. Bryant old, M.S.A. With special chapters by adogan Rothery, Paul Willough- S.Arc., E. W. King (Past-President, Wales Federation of Building Trades' yers), E. J. Strange (Past-President, te of Builders), M.R.San.I., A. C. N, A.S.San.I., R.P. Vols. II and III. 19s. 6d. per vol. (London: Caxton ning Co., Ltd., Clun House, Surrey- W.C. 2.)

bination of theory and practice which make up of scientific modern building n is well illustrated in these volumes nd Cottage Construction.

volume of the series dealt with the pects of the provision of dwellings, n of design with the site and the es of disposition and arrangement of nnection with the points of the com- e second volume begins with a de- f the actual work to be done on the ning the foundation and footings, the e adopted to keep the house dry, and ar practical points. The problem of sloping ground is dealt with, and a on retaining walls will afford comfort readers.

this subject can with safety be dealt efly may be questioned, especially in e statement on a preceeding page in with the levelling of the site. "Ter- be carried on without retaining walls eight is not great, the soil is fairly he dead load of the house is low or the solid subsoil." While this may encouragement to the over-cautious, me a terrible trap to the optimistic only experience can decide the appro- s to be assigned to the expressions " and "fairly good." The distance e of the terrace from the wall base be taken into consideration.

ately the figures given on page 6 for ions of retaining walls are also in- ne optimistic side, and the statement certain circumstances "little more than a facing wall is needed, if built on a slope with buttresses, say a brick thick," is very minutely dependent upon the exact angle of "slope" in connection with the angle of repose of the materials to be supported, and, while this is a matter of general knowledge among constructors, the reader who happens to be ignorant of it will be the one to deceive himself.

The statement "Burnt clay, dug from the site, and broken up, also makes a suitable aggregate for foundation work," might be fairly qualified for the inexperienced by the addition of the caution that thorough burning of the clay is essential to its durability. In most cases the dangers arising from lack of caution are forcibly put before the reader. "Asphalt should only be laid while hot on a dry surface. Excess of moisture on the under surface is likely to cause steam, which gives rise to bubbles and these may burst, so destroying the seal . . ." and vitiating the damp-excluding properties for which the asphalt has been applied.

Some useful hints are given concerning the cause and cure of dampness in walls, and the contention that vegetation should be allowed on walls in the interests of picturesque appearance is combated by the author, who has removed the roots of Virginian creeper from the inside of a 12 in. wall, the roots causing cracks in the walls and peeling away of the plaster.

In connection with brickwork the types of bricks in general use are described, the R.I.B.A. standard of brick dimensions quoted, and several figures given for quantities of different bricks, and crushing and safe strength under live or dead loading.

Bond and reinforcement of brickwork and examples of the use of ornamental brickwork in chimney pieces are also described.

Stonework and masonry are briefly treated as not coming so frequently into ordinary house and cottage construction, and the question of lime or cement mortars and the use of special hollow brick-blocks is debated. The difficulties attendant upon the use of faced and lined walls and veneered walls are pointed out in a separate chapter.

"Mud walls of every description," writes Mr. Newbold, "being composed of non-conducting materials prove cool in summer and warm in winter They, therefore, go far to make comfortable houses. However, they require care not only in building, so as to make them as solid as possible, and to give them the utmost protection, but constant attention as to upkeep. If defects are early detected and remedied at once, the walls will remain weatherproof and stable practically indefinitely, for there are well-authenticated examples of quite ancient cob cottages in Devonshire and *pisé de terre* houses in France."

Half-timber work and its modern equivalent the portable frame building, receive attention, even sham timbering being noticed, but concerning this last we are happy to endorse the author's concluding remark: "it is not a method to be recommended."

The up-to-date wall linings and the more conservative alternative of plaster are compared. For detachable wall finishings it may be claimed that they facilitate the drying out of a house since they do not contain the amount of water that goes to the composition of plaster.

Something like one-third of Volume II is devoted to the discussion of concrete, under the chapter headings of "Concrete: Mass Construction," "Concrete: Blocks and Slabs," "Concrete: Pre-cast Work," and "Concrete: Reinforced Construction."

The third volume continues the treatment in detail of various parts of the house, "ceilings," "roofs and roofing," and "staircases" being dealt with in turn. Under the heading "Carpentry," different methods of shoring and scaffolding are illustrated, and a list of knots used in tying a pole scaffold is given. The knot shown in Fig. 8 is, however, the "cow" and not the "clove" hitch, as described in the text. Fig. 23 correctly illustrates the clove hitch which has the advantage over the "cow" that it is made tighter by pulling on either one or other or both ends of the rope and holds from the moment it is tied.

A great deal of detailed information on "Sanitation and plumbing" (including hot water supply) is contributed by Mr. A. C. Martin, A.R.San.I., who has also written a chapter on "Waste disposal work." Both chapters are excellent. Instructions as to "Outbuildings and Boundary Walls" are followed by Mr. Paul Willoughby's contribution on the "Conversion of Cottages." The plans for conversion are distinctly reasonable.

The third volume is concluded with a chapter on "Repairs" and an index applying to the three volumes as a whole. The work is illustrated by many diagrams, photographs, and by coloured plates reproducing working drawings of house and cottage designs by various architects.

The Builders' History. By R. W. Postgate. Published for the National Federation of Building Trade Operatives by the Labour Publishing Co., Ltd., 38, Great Ormond Street, London, W.C.1. Price 12s. 6d. net.

The National Federation may well congratulate itself upon its choice of a historian. Mr. Postgate has produced a work of extreme interest, and one that has entailed a vast expenditure of labour and research in all parts of the country. So much of the information here contained was otherwise destined to oblivion that this volume will no doubt eventually take its place as the standard work on the trade union movement from its earliest beginnings to the present day.

The outstanding personality in the history of trade unionism is unquestionably that of Robert Owen. Starting life as a model factory owner, he became a pioneer in communistic settlements in America, and when they (naturally enough) failed, he founded co-operative communities or co-operative societies for production. Owen wielded an extraordinary influence over his followers and as time passed appears to have lost to a great extent his mental balance. His dogma that "man's character is formed for, and not by, him" might have been a harmless error if he had not attempted to force this belief and others of the same kind, with their consequences, into his programme of reform, and thereby brought the whole trade union movement to disaster in 1834.

Another commanding personality who, we are glad to say, is still with us, is Robert Applegarth. Beginning his constructive work in 1858, when he was 24 years old, Mr. Applegarth grasped many truths that appear to-day to have eluded the intelligence of many trade union leaders. His essential sanity and breadth of vision were well illustrated in a speech delivered in 1866: "With regard to strikes he would tell them at once that he did not approve of that way of doing business, except in cases of absolute necessity and when every other means had been tried and failed to accomplish the desired object. If they had any grievances they should write to their employers, and if they refused to agree to their terms, or took no notice of their appeals, the best thing was not to strike, but to lay their claims before the public; and the masters would then be compelled to state their objections, on which the public would pass their opinion, which they might consider as the verdict of a jury. If the public agreed with the employers it was of no use for the Society to press their case any further, and if public opinion was with the men it would be no use for the masters to try to hold out any longer, for it was not out of the employers' pockets that the advance of wages or the reduction of hours would come; as in all such cases it was the public and not the masters who had to 'pay the piper.'"

Compare these words with the advice now given on page 448 of this book:—"Their attitude (i.e., that of the employers at the Building Parliament) to-day should warn us to beware of thinking that control of the industry can be achieved by any method of conciliation and constitutionalism. 'We are respected only when we are feared,' and the building workers can attain their victory only by reliance upon their own strength, not upon any appeals to the masters' better nature." It is astonishing that a book written in so impartial a spirit should end with such advice. Mr. Applegarth

saw that the public is and must be the final arbiter, and he realised that a strike that has not public sympathy behind it cannot succeed. Do the trade unions still believe—in spite of all the lessons of the past—that the public is to be made to concede demands irrespective of their justice? Can they still imagine that just demands will get a fair hearing when they are coupled with threats? If so it would appear that the lessons of this excellent history have been so much experience wasted, and the days when Labour will take its rightful place are as far off as ever. The policy of force is as deplorable and futile when wielded by Labour (even if it had it to use) as it is in the hands of employers or anyone else.

Labour often seems to imagine that the man who actually lays the bricks or the man actually behind the gun is the only person who does any real work; the architect who designs the whole structure and the general who plans the whole campaign are treated as though they ought to be thankful to get any recognition at all. Trade unionism is a necessity and, wisely guided, can be a great power for good.

We congratulate the author upon the successful completion of an extremely difficult task which has resulted in a volume as well presented and as attractively written as it is cheap at its price.

Modern Wood-Working Machinery By STAFFORD RANSOME, M.Inst.C.E.

There is a vast store of information in this book for all who are interested in, or will be interested in, wood-working machinery. The operative who reads this work will find much that he would otherwise be unacquainted with. He must benefit by the better understanding he will have of the machine which, as a worker, he is called upon to use. The manager will be better able to advise upon the policy of adopting this or that machine which will be necessary to carry out certain work. The proprietor who finds it necessary to become acquainted with wood-working machinery will be well advised to peruse this work carefully.

It must be understood that the book is written for Colonial and foreign buyers, as well as for the home purchaser, but there are a few further essential points to consider when deciding to lay down a plant. Mention might be made of the Home Office Regulations which may become very costly to meet if not kept fully in mind when the lay-out is considered; also many operatives need more complete instruction upon such important subjects as balance, allowance for throw, and maximum rate of feed, giving satisfactory results in different kinds of material under varying conditions. The manager and proprietor would be able to approach new schemes with more confidence if some approximate idea of cost, based upon a few typical lay-outs, could be given, and a few hints upon rating charges would be invaluable. Even if these several points do not directly apply to the purchaser, they would serve to remind him that there may be restrictions in his district or country that he must conform to. The comparative values in different places are not difficult to compute. Although these points occur to one as being necessary, the book is nevertheless a useful addition to the shelves of all who have an interest in working machinery.

House "Fit for Habitation."

[REPLY TO "INQUIRER."]

SIR,—The enquirer does not state if he was served with a notice under Section 94 of the Public Health Act, 1875, or Section 28 of the Housing, Town-Planning, &c., Act, 1919. If the former, it is open to him to abate the nuisance by doing such works as he thinks will suffice and relet the house, leaving to the local authority any action which it may think fit to take before a Court of Summary Jurisdiction as to any default in complying with the Section.

If the latter, then, under Section 28 and following sections, the local authority has far larger powers; for, though it would appear from the marginal note to Section 28 that it is only confined to repairs, it is thought that the powers given to the local authority by this section go much further, and are not thus restricted.

Unless inquirer can show that works that he proposes to do will make the house in all respects reasonably fit for human habitation, he must comply with the requirements of the notice; and he should get in touch with the local authority and endeavour to settle with it the minimum to satisfy the requirements of the section, especially as in certain circumstances the local authority can do the work required to be done, and recover the expenses incurred.

The inquirer does not say if a closing order has become operative. If there be one and he relets or occupies he is liable to a fine, *i.e.*, £20.

"LEGALITY."

Rights of Light.

[REPLY TO "SURVEYOR."]

SIR,—In reply to the inquiry of "Surveyor," in a recent issue of *The Builder*, the subject of natural illumination has received little or no attention in technical literature. The National Physical Laboratory, Teddington, made numerous investigations for the Home Office Committee on factory lighting, but the Report of that Committee (Cd. 8,000) is now out of print. A résumé of British and foreign research into the subject was embodied in a paper read by Messrs. P. J. & J. M. Waldram before the Illuminating Engineering Society in 1923, together with a description of methods of predetermining the effect of altering existing obstructions, both on natural light and the access of direct sunlight. Copies of this paper can be obtained from Messrs. Batsford.

There are one or two old works, Molesworth's "Obstruction to Light," for example, copies of which can be found in some technical libraries; but the accuracy of the methods which they recommend is not, except as regards direct sunlight, borne out by modern research. I am informed that arrangements are in progress for including the subject in the programme of sessional papers to be read at the R.I.B.A. this year.

A paper bearing more directly upon the effect of natural light on rental and capital value is also in course of preparation by one of the authors of the paper published by Messrs. Batsford.

"P. J. W."

Cavity Walls, &c.

[REPLY TO W. F. KENNELLY.]

SIR,—The concrete slab system mentioned in *The Builder* of September 26 appears to me to be the most satisfactory up to the present, and the speed of building should be, I think, 60 to 70 per cent. faster than building in brickwork. It would be interesting, however, to compare the cost of building a house with cavity walls (as mentioned) with that of brickwork, and I should be glad if any of your readers can enlighten me as to whom and where I could obtain full particulars of this system.

"BUILDER."

Rendering Accounts.

SIR,—I have been a reader of *The Builder* for some years, and through your Architects' and Builders' Inquiry Bureau I should be pleased to receive the following information, viz.: What is the correct method for rendering accounts for jobbing and building works other than works contracted for. Is it usual to give every item of material and labour with the price against each item?

Also, what is the recognised fair gross profit to add to materials and labour for jobbing and other works? Any information upon these points will be greatly appreciated, as I have been in the building business some little time and often have difficulties with accounts.

"YOUNG BUILDER."

Concrete Blocks v. Brickwork.

SIR,—In reply to "Surveyor," I may say that as a general rule the London builders have not sufficient room to make concrete blocks, otherwise their use would be general in London, for they are much cheaper and a building can be erected in half the time that it takes for bricks. A properly made concrete block is waterproof on the "face," and no condensation will appear on the inside.

There is a machine on the market which, with one man, will make 150 blocks, 18 in. by 9 in. by 6 in. in eight hours. This is equal to 1,200 bricks, and each block, which is equal to eight bricks, can be produced at 3½d. each. Rock face, pebble dash, rough cast, or imitation stone finish can be given to these blocks, and colour finish can also be employed to advantage.

There is also a great saving in mortar, for a concrete block only requires the same amount of mortar as used for four bricks, and a concrete block can be laid in the same time that it takes to lay three bricks, thus there is a saving also of labour.

J. WOOLLARD.

Sand Lime Bricks.

SIR,—Your note upon the abundance of brick earth in this country as the cause of the non-use of sand lime bricks is so very correct that any word added thereto will be uttered with the utmost diffidence. There is, however, an acknowledged shortage of bricks, and it is difficult to understand this in the light of the abundant natural supplies of the raw material. It can only indicate some influence of a purely artificial character at work. If there is anything in this, any competitive method that can be found to stimulate the limitless potentialities of brick-making should be encouraged in every way, and the sand lime brick does seem to answer very well as a substitute. The concrete cement block cannot at present compete, owing to the relative costs of the component parts of brick and cement, in their raw state; but the sand lime brick starts on sound ground and should do well in this country at any rate for a time.

"COMPETITION."

Grano-Paving.

SIR,—We have it dinned into us from a very early stage of studenthood, that cement should not be beaten up again after it has commenced to set, and yet the usual practice of laying cement grano-paving is to allow the surface to initially set, and then scour it to a fine surface. The result, when performed by skilled workmen, is a very fine hard surface that has been observed to wear well in many instances. Can any reader explain this apparent ambiguity?

"STUDENT."

Brands of Timber.

SIR,—The quality of timber with which we have been served since the war days has rendered the job of supervising building doubly difficult and responsible. Probably the only safe way finally to judge timber is by the brand, and as these have been much altered of late years, a sound source of information is missing. Could any reader inform me where an up-to-date list of timber brands can be obtained? Many timber merchants seem very shy of giving this information.

"CAUTIOUS."

THE BUILDING TRADE

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.San.Inst. (Barrister-at-Law).

XIV.—DEFECTS AND MAINTENANCE.—PENALTIES AND LIQUIDATED DAMAGES.

It is obvious that the system of visiting the works at intervals does not bind the architect to detect every defect in its initial stages—and the "Conditions of Engagement" set out by the Royal Institute of British Architects provides that "constant superintendence of the works does not form part of the duties undertaken by him and is not included for"—in the scale of charges.

Defects and Maintenance Clause.

For the above reason, and in the interests of both parties, contracts usually include a "defects and maintenance" clause—which protects the employer against damage from defective work and its results within a reasonable time—usually six months—and, on the other hand, determines the period of liability, in respect thereof, on the part of the contractor. The contractor must be allowed opportunity to make good the defects complained of.

The contractor cannot be held liable for damage from "wear and tear" during this period, unless such wear and tear is the direct result of defects for which he is liable. He is, however, liable for defects the causes of which may not be ascertained until after the period of maintenance. It is only in very aggravated circumstances that a contractor can be held liable for defects appearing after the expiration of the period; the architect's final certificate of satisfactory completion provides the contractor's release, unless fraud or collusion can be proved. But the contractor is at any time liable for defects pointed out to him during the maintenance period.

Fire—Frost—Inclement Weather.

A clause for "defects" only does not impose liability for damage from these causes; but if "maintenance" is included the contractor must prudently insure against fire, and make any allowance necesary for climatic difficulties, as he will then be liable for all these, during the period fixed.

Improper Work.—Opening Up.

Usually the architect is empowered to order the removal of bad work, during the currency of the contract; but it would appear that, with the expiration of the maintenance period and the granting of his final certificate, his power ceases.

The architect may also demand that work be opened up for the purposes of inspection, up to the end of the maintenance period, if he has reason to believe defects may thereby be disclosed.

Sub-contractors.

The general contractor should, in all cases, see to it that sub-contractors undertake liability for all matters connected with their sub-contracts, where liability is laid on himself by the general contract, if such is his intention. However, if a sub-contractor is engaged directly by the employer, the general contractor can only be liable for defects or damage in the work, if he has expressly contracted to take over this responsibility.

Penalties and Liquidated Damages.

It is usual to protect the employer against undue delay by fixing a sum—per day or week—to be paid as a fine or penalty, during the period following the agreed date of completion.

A penalty is recoverable up to the amount of actual damage or loss caused; liquidated damages is the exact sum named, being taken as the previously ascertained loss to the employer in respect of delay.

In an action for damages, the Court may interchange these two terms, in construing the phraseology of the contract, according as the intention of the parties is ascertainable. Because in practice they are often used carelessly, the one for the other.

Anson's Rules.

These are useful as a guide to the correct employment of these two terms:—

1. If a contract is for a matter of uncertain value, and a fixed sum is to be paid for the breach of one or more of its provisions, the sum may be recovered as liquidated damages.

2. If a contract is for a matter of certain value, and on breach of it, a sum is to be paid in excess of that value, this is a penalty and not liquidated damages.

3. If a contract contains a number of terms, some of certain and some of uncertain value, and a fixed sum is to be paid for the breach of any of them, this is probably a penalty.

These rules may be applied to the clause fixing the date of completion.

Rule (1) would apply where the clause fixed a fine per diem or per week in delay in completion. And it would therefore, correct to describe these "liquidated damages" in a building

Bonuses for Earlier or Punctual Co

It is sometimes offered, in conjunc the penalty clause, that bonuses will if the work is completed punctually the date fixed. These bonuses may claimed by the contractor, even if is delayed *beyond* the fixed date, w if, he can show hindrance on the pa employer, as having prevented him fr ing them. For instance, hindrance the advent on the work of sub-co controlled directly by the employer agent, has been successfully pleade reason why bonuses should be paid general contractor, whose work was delayed, when otherwise he would ha pleted, and earned the bonus.

Building Surveyors' and Inspectors' Ass

A meeting of this Association w recently at Liverpool. It was arra hold the next two quarterly meeti January 10 and April 4, 1925, at Ma and Liverpool respectively, and to in members of these towns to arrange fo or lectures to be given at each meetin Association also decided to offer a three guineas for the best paper submi "Reinforced Concrete."

ON BUILDING TRADE FRICTION

e received the following letter from nks, Organiser, A.U.B.T.W. :—

rave your indulgence to deal with points raised by your correspondents *der* of September 19 and 26. In the I agree with Mr. Steffens when he ie desire for an exchange of views on In some way the present relations e London builders and operatives go a change if the present chaotic are to be improved; certainly it redit to any of us. If more publicity n on the actual negotiating proceed- ht be the means of assisting in a of affairs existing.

onal settlement has proved, as some pated, to be no settlement at all so on is concerned. We did expect, in e facts and circumstances existing e dispute, that any terms of settle- ted would have provided either ns, or some machinery whereby the would have been dealt with. Instead mediately we settle down to apply es in terms of National settlement round to exactly the same position or to the dispute.

ult is it we have again arrived at ? Have our National representa- or have the London builders failed e the spirit and intention of refer- don ? Or is it the stupid pursuit of he operatives which is the cause ?

to the settlement the London uncil met a few days after the dis- osed for the purpose of discussing g agreement on outstanding differ- employers insisted before any dis- vages should take place we were to -hour week. To this we demurred, t that in our opinion clause 5 of the ttlement was an instruction by way o go into not only hours, but wages matters. The operatives proposed eed by way of inquiry into all these h the idea of reporting results of ie members of both parties, but pposed. In view of the deadlock it ggested from our side that we invite ves from the National body to meet ves of London employers and nd thus try to effect an agreement. employers took up a negative

tives' policy was directed broadly to differences under clause 5 in the curing agreement. We feel the atisfactory situation does neither continual unrest in shops and on tly business to employers, building more especially to trade unions. p but think employers are badly led; raining at the letter of terms of vithout regard to the facts of the ion, and simply ignore the spirit side of the problem. There can be relations getting back to normal in nosphere.

, in the interests of all, that after ion the employers will take a w. If not, do they imagine the ext spring, will accept in a docile ½-hour week ? No; he will be ed at the attitude taken up by the he result being more and more

gs me to the argument used by one respondents, to the effect that the a big majority of cases, wants s. What a singular thing the able to gauge the requirements of s better than their own represen- ere are some operatives who have for a 44-hour week; they never for 50, or, for the matter of that, eek. Trade unions cannot allow dominate its activities any more I.B.A. can look with favour on un- or extreme selfish elements domi- nating its policy. I would suggest to any employer it is not wise to lend too free an ear to such cases; the union is the authority. We could with just as equal force point out many builders do not agree with the policy of the L.M.B.A., but we accept that Association as the authoritative body for builders in London.

Apart from the main reasons on the hours' question, there are special reasons why the employee in London insists on a 44-hour week. Mr. Steffens, in your last issue, draws attention to time spent travelling. There is not another centre where the operative puts in so much time in this direction. Again, the L.M.B.A. insist upon the employee working 8½ hours a day with one break, viz., dinner hour. This cannot be done, except at the cost of efficiency. Just imagine a man or youth day after day having only one hour break in ten or ten-and-a-half hours occupied in work and travelling. I estimate the majority of employees to be in this position in London. This is neither rational nor human, and I am sure such a proposal is not based on the knowledge of the power of any physical frame responding so far as efficiency goes. The 44-hour week is worked in other centres; the London operative thinks he is just as much entitled to it, or more so, for reasons stated.

There are, in spite of differences of opinion, strong reasons why immediate steps ought to be taken to straighten out our differences. A Micawber attitude is unwise. No agreement will be worth the paper it is printed upon without the confidence of the operative is at the back of it. I would strongly urge an inquiry, and as a result submit terms to the rank and file. These could be alternative in character. The men are beginning to kick against the bureaucratic method of settling his working conditions; there must be some attempt made to place more direct responsibility upon him; this is one way of getting confidence.

INDUSTRIAL PEACE

An article by Sir Robert Hadfield which recently appeared in *The Times* contained some tables showing the number of working days which had been lost in each year of this century by trade disputes, and, as we have so often done in these pages, he makes an estimate of the money loss in wages arising from this cause. Thus, from 1900 to 1923 he shows that 315 million working days were lost, representing an estimated sum of £157,000,000 in wages, and this sum represents the loss only to those directly involved in the dispute, and not to those indirectly involved.

It is always impossible to calculate the loss to the country as a whole from every dispute, therefore particular interest is given to the example which Sir R. Hadfield gives as to indirect loss suffered by those employed by his firm, and he states that in the years covered by the period 1919 to September this year the wages lost amounted to £730,000 from disputes in which his workpeople were not involved and from which they derived no benefit. It is significant to find such an experienced Trade Unionist as Mr. George N. Barnes in his recent work, "Industrial Conflict: The Way Out," also referring to the waste of productive energy through strikes and lockouts, and urging the necessity of peaceful methods for the settlement of disputes, and it is especially remarkable that he should advocate the making of voluntary associations of employers and employees legal entities which shall be sueable at law for inconsiderate action inimical to the public interest. We have always strongly deprecated the placing of bodies outside the law of the land in the manner that was first inaugurated by the Trade Disputes Act, 1906. That Act did not make combinations of employers or workmen legal entities, but placed them altogether outside the law as irresponsible bodies, and it is a totally anomalous position.

We may allude to one point not mentioned in the article we have referred to, but which we believe is inimical to industrial peace, viz., the Act which in 1913 gave political powers to Trade Unions. We all know how careful we are to avoid political discussions in any matter of ordinary life, as religious and political opinions are considered sacrosanct to the individual himself, and any interference with those opinions is justly resented and stirs up strong feeling at once.

The Trade Unions are industrial bodies having recognised and very important functions to perform in relation to industrial affairs, but by this Act they have been converted into political bodies, and all the heat engendered by politics has been imported into their system, often to the embarrassment of the leaders themselves.

One of the first steps to attaining industrial peace would, in our opinion, be to attempt to sever the industrial from the political aspect of industrial affairs, and to keep the two questions in watertight compartments, as far as is possible. The Labour Party are now in a position to organise any political caucus apart from the Trade Unions, and are fully entitled to do so, but the importation of politics into industrial questions on the face of it cannot make for peace, and we should wish to see those great industrial bodies, the Trade Unions, restored to their true functions: the regulation of industrial conditions of labour.

PAINTS AND VARNISHES*

This work claims to be written from a strictly practical standpoint. The author has had twenty years' experience in the industry, and it is safe to assume that during this period he has had many opportunities not only of obtaining a first-hand knowledge of the practical application of chemistry in connection with painters' and decorators' materials, but that he has been able to bring his theories into line with the industrial needs of users of such materials. The book is printed on excellent paper, in a good, clear type which is easily readable. The matter is contained in 267 pages, and is very carefully indexed. A full description of the methods of analysing raw materials and finished products is included. It thus provides a much-needed book of reference for all who find it necessary to know more about the materials they propose purchasing than can be ascertained by ordinary rule of thumb or experience. In many books of this type the chemical terms used are not easy for the layman to understand, but in this case the author has used the term by which the material is known in the works, and has given the chemical equivalent in addition, thus making it quite easy for anyone with but little previous knowledge to understand what is meant. Generally, his descriptive matter is very clear and lucid. The book is very conveniently arranged in three parts.

Part I deals with: Paints, their composition, properties and uses. It explains the machinery used in the manufacture of paint, white and coloured, enamels, anti-corrosive and anti-fouling paints, distempers and cold-water paints.

Part II deals with: Inorganic and organic pigments, their preparation and properties. A good general description of the method of manufacturing white lead is given; the Dutch, Chambers and Thenards, and other processes being explained. Lime oxide and lithopone receive considerable attention, and the newer white pigments, antimony oxide and titanium white, are described.

Part III deals with: Varnishes, lacquers, and japans. In the first chapter there is a general introduction to varnishes, &c., colophony, soft resins, balsam fossil gums, and raw materials receive a considerable amount of attention. In the two chapters following, drying oils, linseed oil, solvents and diluents are dealt with. The chapter devoted to varnish is invaluable. The final chapter is devoted to Brunswick blacks, japans, and stoving enamels.

The book is well illustrated and the diagrams are excellent.

UNEMPLOYMENT INSURANCE

THE Umpire appointed under the Unemployment Insurance Acts has recently delivered a decision on a point under the Act of this year. The principal Act of 1920, by section 8. subsection (1), disqualified an insured contributor from receiving benefit during a stoppage of work due to a trade dispute; but section 4 subsection (1) of the Act of 1924 has amended this provision by providing that subsection (1) of section 8 of the principal Act shall not apply, amongst other cases, where the stoppage arising out of the dispute " is due to an employer acting in a manner so as to contravene the terms or provisions of any agreement existing between a group of employers where the stoppage takes place, or of a national agreement to either of which the employers and employees are parties."

The facts of the case appear to be as follows: On June 18 there was a stoppage of work in the South Liberty Colliery, Bristol, and the cause of the stoppage was a dispute as to whether or not the employers were bound to pay wages in accordance with a " National Wages Agreement " made between the Mining Association of Great Britain and the Miners Federation at the end of May, but signed on June 18. The Bristol owners on the day previous to the signing of this agreement had resigned from membership of the Mining Association.

The Umpire found that the employers were members of the Bristol Colliery Owners Association, which Association is a constituent member of the Mining Association of Great Britain, and the National Agreement purported to be made by that Association on behalf of all its constituent Associations and the Bristol district was expressly included: That the Mining Association had power to make national agreements; and although it was provided that no local questions relating to wages could be taken out of the hands of a local association except at their request, as by the rules of the Association all questions were to be decided by vote, it must be inferred that the members were bound by such vote. Then, as to the question of resignation, the Umpire held that the Bristol owners were in fact members of the Mining Association when the agreement was made, and although they gave notice of resignation the day before the agreement was formally signed, that resignation had not become effective, as by the rules of the Association twelve months' notice was required. In the result the Umpire held that although the Bristol owners had protested that they would not be bound by any National Wages Agreement, yet by their membership of the Mining Association they were parties to the National Agreement, and the stoppage of work was due to an employer acting in contravention of a national agreement within the meaning of the section, and the men were entitled to unemployment insurance.

It will be seen that in these days of combines of both employers and employed the decision is of great importance.

The first part of section 4 subsection (1) of the Act of 1924 is as follows: " Subsection (1) of section 8 of the principal Act (which imposes a disqualification for the receipt of benefit during a stoppage of work) shall not apply in any case in which the insured contributor proves that he is not participating in, or financing or directly interested in, the trade dispute which caused the stoppage of work, and that he does not belong to a grade or class of workers, members of which are participating in, or financing or directly interested in, the dispute, or that the stoppage is due "—here follow the words quoted at the commencement of this note relating to contravention of agreements by employers, and it will be seen that where a breach of agreement takes place, then even those men participating in the dispute and possibly actually on strike can claim benefit. Where a deliberate direct breach of agreement has taken place between an employer and those directly employed by him, caused solely by the employer, it may appear reasonable that the men who suffer from the breach should not be deprived of benefit, but in these days when associations of employers and of men are formed on a large scale and agreements are framed comprising all sorts of conditions to be applied over a wide area, it is obvious questions must arise which may require adjustment, but it appears to offer an incentive to cease work if unemployment pay should be deemed to be secured to those participating in the dispute. It is thus as well to point out that this is not the case either under the section or this decision, as after the stoppage of work has taken place it still has to be proved by the insured contributor that the stoppage, in fact, was due to contravention of an agreement by the employer, that is to a breach of contract and faith on his part. All the same, the slightest variation of a contract would appear to make the section apply, and it may be doubted, therefore, if it will not tend to encourage a litigious rather than a peaceful spirit into industrial affairs.

ESTIMATING BUILDING COSTS *

THIS work on building costs in America is well printed, classified and illustrated. It contains chapters on most of the branches of the building trade, including excavations, concrete, ferro-concrete, stonework, joinery, structural steelwork, plumbing, plastering, electric lighting, heating, &c., and in each of these trades the costs of various materials and labours are clearly stated. It is interesting to notice that in New York a bricklayer will lay 1,000 common bricks on a 16 in. warehouse wall in 6¾ hours. American bricks are slightly smaller than the London stock brick. List prices of polished plate glass are given, and the discount of 75 per cent. is stated. It is a very long time ago since such discounts were allowed from plate glass tariffs in England.

In each chapter hints are given as to the best method of carrying out the work in each trade, which should prove useful. A considerable section of the book is taken up with information on " Appraisal of Buildings," and it is claimed that by the use of the data given it is easy to estimate the cost to reproduce almost any building constructed since 1890, of which the original cost is known, and thus many pages are filled with tables and examples of building costs, the reliability of which is claimed as an essential feature of the book.

Being a work of reference for A money values are stated in doll system of measuring differs fro London practice. The book is a v of information and can be reco contractors and their assistants, a business it is to use such informati

NATIONAL FEDER OF MASTER PAI AND DECORAT

THE annual meeting of the Nati tion of Master Painters and D England and Wales was held Newcastle.

The President, Mr. J. W. Alder, i of his address, said the man who decorator must spare no effort to r efficient and to enlarge his know wonder of design and the mystery o if by reason of a prospering and grow the opportunity of personal part craft processes was denied him, sound knowledge of these process greater, for he had to direct the wor mand the respect which was given only to those whose craft knowledg This matter of personal efficiency sh first, but alone it was not enough. follow a concern for the efficien welfare of the whole craft, and organisation.

There was, in the records of the ear of the old National Association Painters, evidence of a wonderful pri a desire to safeguard good craftsma to do all that was possible to ach standards. That was the foundatio the organisation was built, and thos knew the work that had since been the most convinced of the rightness that the founders adopted.

He did not wish to imply that the side of their calling was a negligible Federation cared not only for ideals tions, but for the material welfare of i But the basis, the foundation of al had done and hoped to do, was pride itself, and in the efficiency with delighted to follow it. Before all h the work of education. Painting which when served faithfully by it offered to the community a service o might well be proud, and as to whi little need to keep silent.

The following officers were elec dent, Mr. J. F. Butterworth, Manc vice-president, Mr. H. S. Mannin treasurer, Mr. Foster, Burnley; se W. G. Sutherland.

Barclays Bank, Tavistock.

MR. A. FOSTER, Architect.

[The Beer stone on this building was worked, fixed, and cleaned down by the F Co., Ltd., of Seaton. The builders were Messrs. J. Kersmill & Sons, of T

NEW INVENTION

Concrete Blocks.

THE British Manufacturers' and Inventors' Guild, of 5, Cornwall-street, Birmingham, have sent in particulars of a new type of concrete block, known as "Maseyk's Ventilated Concrete Block."

In this system it is stated a system of horizontal and vertical ventilation combine to make the inner face of wall completely dampproof, equal to that obtained by cavity brick walls, with a saving of 25 per cent. in material.

The top face and one end of these blocks have a 3 in. by ¾ in. rebate along each side, to give a bond to the wall and act as a guide gauge for placing the next layer of blocks in position, and the arrises of these rebates act as a gauge for the thickness of mortar.

Unskilled men, it is stated, can master the laying of these blocks in a day under skilled supervision, or skilled men using 36 in. by 9 in. by 9 in., or 27 in. by 9 in. by 9 in., or 18 in. by 9 in. by 9 in., can build walls in half the time necessary with bricks.

The system of ventilation commences with inlets on the outer face at dampcourse level, the outlet being at top of wall wherever finished. No galvanised iron ties are required on any walls.

The blocks can be made by machines at the rate of from 80 to 100 blocks an hour in 36 in. by 9 in. by 4½ in.; other sizes proportionately.

Where unskilled labour is largely employed it is recommended that walls be built from dampcourse level to wall plates or gable tops without joists. The joists are then carried on, say, 6 in. by ⅜ in. iron plates, built into wall angles as the job proceeds, at any desired height, on which trimmer joists, cut to clear the walls, may rest.

A CLAIM FOR BUILDING ALTERATIONS

IN the Shoreditch County Court recently, before Judge Cluer, a firm of jobbing builders sued Mr. Mark Rabinowitz. a wholesale cabinet manufacturer, to recover £50, being the balance of an account rendered and agreed upon in November, 1923. The plaintiff claimed that he had carried out the alterations at the premises of the defendant according to contract, and had rendered accounts amounting to £584 19s. He had received £530 on account, the last being in November for £20, when he agreed to take for the balance of £54 19s. the sum of £50, now sued for. On the other hand, the defendant pleaded that the payments had been made on the understanding that the plaintiffs would complete their work, but they had failed to do so, and it would cost £40 to carry out the uncompleted work; besides which he was asking for £20 as damage done to his cabinets and side boards through the rain coming through the defective roof, which the plaintiffs were supposed to have put in repair.

Mr. B. M. Goodman appeared as counsel for the defence, and the plaintiff in person.

In his evidence, the plaintiff said that he had no papers to produce in connection with the case, as he had been turned out of his house, his furniture was in store, and he could not get at them. When he took the £20 in November, it was agreed to settle his account finally for £50. In cross examination, he agreed that the receipt he gave said on it, "£55 balance: work to be finished." He went on to say that the £50 was agreed upon after that, and said it was a pity that that fact was not written in, but it was due to him not being a good scholar. The defendant had always complained about the work whenever he asked for any money. Since the arrangement of the £50, he had never been near the defendant except to ask for money, as he had done all the work there that he intended to do. It was true he had had a letter that the roof was leaking and was spoiling cabinets, but the fault was that it was a brick roof, which was spongy and allowed the water to get through. He also got a letter to say that if the work were not completed by January, defendant would have to get it done by someone else, but he never replied to it. This closed the plaintiff's case, and Mr. Claude William Dennis, manager to Messrs. Francis Dodd & Co., surveyors, gave evidence, and said that it would cost the defendant £52 8s. to complete the work which the plaintiffs had agreed upon originally.

Mr. Justice Cluer said if they, on the accounts sent in for £54 19s. completed the work themselves, they would have more than enough in hand to do it. It only left the matter of the £20 for the damaged cabinets and sideboards.

Mr. Goodman said they would not press for that, and Mr. Justice Cluer then gave judgment for the defendant, with costs.

RENT RESTRICTION

NOTICE OF INCREASE UNDER NEW ACT.

THE first case decided under the Rent Restrictions (Notices of Increase) Act, 1923, is now reported, Landrigan *v.* Simons (*Weekly Notes*, December 5), and is therefore of importance. The case arose in connection with premises in Francis-street, which were within the Rent Act, 1920, and of which the plaintiff was tenant and the defendant landlord.

In January, 1923, the landlord had served upon the tenant a notice to increase the rent, but no notice to determine the tenancy had been given. The tenant had apparently paid the increase, for on May 2 she took out a summons in the County Court claiming £26 18s. 11d., sums which she alleged had been paid in excess of rent. The County Court Judge had held that as no notice to quit had been given the increase in rent was not legally claimable by the landlord, on the authority of Kerr *v.* Bryde (1923 A.C. 16, *The Builder*, November 17, 1922), and he gave judgment for the plaintiff, but the landlord appealed, and on the appeal the following contentions were raised:—(1) That the Rent Restrictions (Notices of Increase) Act, 1923, was retrospective; (2) that the point of law as to the general efficacy of the notice having been raised at the trial it was open to the landlord to invoke in aid the new Act on appeal, although that Act was not passed at the time of the original hearing; (3) that the new Act was in the landlord's favour certainly as regards the rent up to December 1, and that with regard to the rent since that date the proviso at the end of section 1, subsection (1) (*a*) was not intended to cut down the effect of the general enactment.

It must be noticed before dealing with the judgment delivered by the Divisional Court that the case was heard in the County Court, June 5, 1923. The Rent Restrictions (Notices of Increase) Act was passed and came into force June 7; the appeal was heard November 22 and judgment given December 19. The Divisional Court held (1) the Act of 1923 was retrospective, (2) that although it was not passed at the time of the original hearing it was applicable on the appeal, following the case Stovin *v.* Fairbrass (1919, *Weekly Notes*, p. 217; *The Builder*, July 25, 1919), and (3) the Act validated increases of rent, although no notice to quit was given, by making notice of increase take the place of a notice to quit, but as regards the sums paid everything done up to December 1, 1922, was to remain undisturbed, and the position was crystallised as at that date. The Court is reported as having laid it down that the first part of section 1 of the Notices of Increase Act was not cut down by the last words of the proviso to that section beginning with the word "but."

To make the decision clear it is necessary to refer to the Statute itself. Section 1 subsection (1) commences "Where notice of intention to increase rent has, whether before or after the passing of this Act, been served upon a tenant in conformity with subsection (2) of section 3 of the principal Act (the Act of 1920) "and a notice to terminate the tenancy was necessary in order to make such increase effective, the notice of intention to increase the rent shall have effect, and shall be deemed always to have had effect, as if there were or had been also a notice to terminate the existing tenancy on the day immediately preceding the day as from which the increase is or was first to take effect, or on the earliest day thereafter on which, if it had been a notice to terminate the tenancy it would have been effective for that purpose, and in the latter case a notice of increase served before the passing of this Act shall be deemed to have had effect as if such earliest date had been specified in the notice as the date from which the increase is to take effect."

Before passing to the proviso we may point out that the wording of this part of the section clearly indicates an intention to make the Act retrospective in this connection, as has already been held in this case, and as we pointed out in our note to Michael *v.* Phillips (*The Builder*, March 30, 1923), a case affirmed on appeal, all the Acts have a retrospective effect, so far at least as increases of rent are concerned.

Proviso (*a*) is as follows: "Nothing in this Act shall entitle a landlord after the passing of this Act to recover from a tenant, in respect of any period before December 1, 1922, the increase of rent made valid by this Act, or any sums which have been recovered from the landlord before that date by means of deductions from rent or otherwise, or any rent due before that date which has not been paid by reason of deductions having been made therefrom, and section 14 subsection (1) of the principal Act shall not apply to an increase of rent rendered valid by this Act which was paid by, or recovered from, a tenant prior to December 1, 1922."

Subsection (1) of section 14 of the principal Act, here referred to, made any sum (whether paid before or after the passing of that Act) paid in respect of rent which was made recoverable by the landlord by that Act, or by any Act repealed by it, recoverable by the tenant, and the effect of the proviso therefore appears to be that a "validated increase of rent," that is an increase of rent made valid by the Notices Act, 1923 [see section 1 subsection (1)] cannot be recovered by a landlord in respect of any period before December 1, 1922, if paid by or recovered from the tenant, but that date be recovered back by the tenant.

It may, however, be noticed that whereas the first part of the proviso and the latter part appear to the same apply to "validated increases" as far as the landlord is concerned, the latter portion goes further, "or any sums which have been recovered from the landlord before that date by means of deductions from rent or otherwise or *any rent* due before that date which has not been paid by reason of deductions having been made there-from," these words seem not limited to "validated increases."

In conclusion, we may point out that the facts of this case do not appear to have raised the question as to rent so far back as December 1, 1922, as in the short report of the case at present available it appears the increase was first demanded from January, 1924, and it is stated to have been treated as a "validated increase," but the report does not state what the circumstances of the tenancy was, and it therefore must be assumed that the notice of increase was sufficient as validly to determine the tenancy in accordance with the provisions of section 1.

We may have to revert to this case when fully reported.

The Royal Naval Hospital, Plymouth

An extension of the Royal Naval Hospital, Stonehouse, Plymouth, has just been commenced. It is estimated the work will cost over £30,000.

CONTRACTS, COMPETITIONS, &c.

e contracts still open, but not included in this List, see previous issues Those with an asterisk ised in this number. Certain conditions beyond those given in the following information d in some cases, such as that advertisers do not bind themselves to accept the lowest or any hat a fair wages clause shall be observed; that no allowance will be made for tenders; and its are returned on receipt of a bona-fide tender unless stated to the contrary.

given at the commencement of each paragraph is the latest date when the tender, or the names ling to submit tenders, may be sent in; the name and address at the end is the person from whom ere quantities, forms of tender, &c., may be obtained.

LDING AND PAINTING.

4.—London, S.W. 1.—DEMOLITION.—ion of temporary buildings at the War he Commissioners of H.M. Works, &c. anch, H.M. Office of Works, King Charles- 1. Deposit £1 1s.

ATE.—**London, S.E.1.**—Architectural Assis- ired for temporary engagements in the Department of the London County Council. o the Council, County Hall, Westminster E.1.

OING EDUCATION IN ASHIRE & CHESHIRE

TING of the Lancashire and Cheshire Trades Teachers and others interested eld on October 18, at 2 p.m., at the r College of Technology, under the hip of Mr. D. W. Steele, of Wigan.

t will be given on the work done by ommittee which is composed of (*a*) of the Manchester Branch of the of Builders, and (*b*) Building Trades This joint committee was formed conference between the Manchester the Institute of Builders and Building engaged in the various Technical f Lancashire and Cheshire, held in r on October 13, 1923.

ging progress has been made as a the meetings held, and the friendly p now established should, with a e of effort, produce beneficial develop- all sections of the building industry.

owing is the agenda for the meeting :— ort of teachers' representatives on ittee appointed to meet the Institute rs. Mr. E. M. Pearson, Preston. g Examinations and the necessity for rtificates. Discussion introduced by Riley, Rochdale. (3) Training for itions in the building industry. Dis- roduced by Mr. F. E. Drury, Man- 4) The introduction of trade courses. introduced by Mr. W. F. Anderson, 5) Any other business.

ipals, teachers, employers, employees interested in technical education and r the building industry are invited to orrespondence to Mr. W. F. Anderson, School, Bolton.

Drury-lane Theatre.

of the steady trend of the public e cinema is seen in the conversion f the theatres into picture houses, -sighted management of Drury-lane alising this, has not been left behind rch. It has set before its public f the Arabian Nights par excellence. s full of thrills and adventure, with airbanks in the title role; and, the long queues which are seen waiting at the box office, it looks the "Lane" will draw all cinema spacious and comfortable house—not but many times, where "The Thief " may be seen twice daily.

BRITISH COMMERCIAL GAS ASSOCIATION.

Dr. C. W. Saleeby lectured last Monday before the members of the British Commercial Gas Association, at the Town Hall, Liverpool.

In the course of his remarks, he said the secret of the power of light was that it exalted the self-defending powers of the blood. They could not expect the results of true sunlight by sitting behind a window. A substitute for window glass was needed in hospitals and other places where children were cared for. Quartz would serve the purpose, but it would be extremely expensive. It was time they restored the light of day to their cities. He advocated the school in the sun, for normal as well as ailing children. A recognition of the value of sunlight and fresh air was the flight of hospitals from the cities to the country. Several London hospitals were moving in that direction, and Sheffield, "a smoke cursed city," had a scheme to transfer its four hospitals into the country, a park having been bought for the purpose. The result of the abolition of coal smoke in New York was that between 1905 and 1919, pulmonary tuberculosis was reduced one-half, and there had since been an even greater fall.

On Tuesday, Mr. H. Wade Deacon delivered his presidential address. In the course of his remarks, he said in Liverpool, though they had some tall chimneys which were not blameless, yet it was true to say that, in the bulk, the domestic hearths were the greatest sinners. It was only necessary to think for a moment of what St. George's Hall, the Art Gallery, the Town Hall, the Dock Offices, to name only a few of their chief architectural attractions, would look like to-day if they had not been blackened and disfigured by the smoke from those open domestic fires to which they were accustomed. Let them think of the sad change that must occur in the colour of the stonework of their new cathedral in the course of only a few years, not to mention the more serious question of decay, if they continued to employ raw coal in their fireplaces.

In England, they had not the advantage of a great supply of water power possessed by some of their competitors in other countries, and the consideration of the possibility of obtaining a quantity of such power by damming the Severn was only now entering upon its early stages. As they had no oil wells, the one great source of power in their own land was—for the present, whatever the future might bring—coal; and as their stores of coal were being used up rapidly, it was necessary, in the national interests, that the utmost possible use be made of the coal they had. The vital importance of this matter was a subject which the gas industry would have to lay, with all the force it could command, before any Government which considered the question of the power resources of this country. The important point to bring constantly and plainly to the notice of all who were considering power schemes was that the term "power" must be restricted to the limited meaning of "motive power," and not be used to include the provision and use of heat, as such, and that the problem of coal conservation and utilisation must be considered as comprising two separate main considerations: (1) The economic utilisation of coal as a source of smokeless, labour-saving motive power; and (2) the economic utilisation of coal as a source of smokeless, labour-saving fuel. While the answer to the one might be largely—it was by no means wholly—"electricity," the answer to the second was almost entirely "gas and coke."

In conclusion, Mr. Deacon said not only existing conditions, but any conceivable conditions, must involve conflicting interests, and, so long as there were conflicting interests, there must always be the possibliity of strife. The great object of reasonable men was to remove, as far as they could, the causes which led to such violent and really anti-social acts as strikes and lock-outs. Much might be done, he thought, by trying to understand each other's point of view, in spite of difficulties which often undoubtedly existed, and by deliberately cultivating an attitude of readiness to believe in each other's honesty and good will. It was because he believed that co-partnership helped to form that attitude that he was a firm supporter of it wherever it could be applied.

PATENTS

APPLICATIONS PUBLISHED.*

217,654.—T. G. Allen: Systems of raising liquids.
217,658.—F. Jordan and F. Andrew: Kitchen table.
217,664.—D. H. Remfry: Construction of bridges.
217,669.—British and Foreign Industrials, Ltd., and J. G. Nash: Kitchen and similar tables.
217,692.—A. Rowlands: Kitchen ranges.
217,713.—E. Lumb: Building blocks.
217,718.—D. J. Munro: Construction of silos.
217,759.—H. K. Bromhead: Balanced window sashes.
217,791.—C. H. Harrison: Manufacture of reconstructed stone
217,802.—F. R. R. J. Pearce: Ventilators for rooms
217,812.—J. H. Delaney: Production of vermiculated appearance in artificial stone and like building materials.
217,813.—O. J. Looney: Locks.
193,062.—Jones & Laughlin Steele Corporation: Metallic structural elements.
218,720.—J. Hodson: Manufacture of basic bricks, furnace linings and retorts.
218,752.—J. R. Torrance, W. G. Hamblin and Torrance & Sons, Ltd.: Adjusting device for the rolls of grinding, crushing, pulverising, and other machinery.
218,760.—T. Debenham: Manufacture of concrete pipes.
218,764.—G. Meroni: Wooden furniture.
218,785.—R. Reinisch: Office desks.
218,810.—M. Haramiishi: Ferro-concrete walls.
218,819.—C. F. Hyde and S. Knott: Roads, floors, and like surfaces.
215,301.—C. T. Weymann: Apparatus for operating vertically-sliding windows.
218,858.—J. H. James: Latches for doors.
218,867.—L. Lombardi: Central heating of buildings.
218,874.—Armstrong Siddeley Motors, Ltd., and J. D. Siddeley: Manufacture of plywood.
206,480.—J. Deny: Folding seats.
218,876.—R. Hickton and W. Bagguley: Brick-making machines.
218,933.—M. J. Adams: Fire-places.
211,478.—Anaconda Sales Co.: Process for manufacturing roofing elements by electrolysis.
218,958.—G. Crowther: Supports for drilling braces and scaffolding.
217,947.—L. J. Hancock and T. R. Hancock: Heating apparatus.
217,949.—P. E. Sabine: Sound-absorbing plaster.
217,970.—P. Dumont: Lime-kilns.
218,015.—Benham & Sons, Ltd., and C. R. Allensby: Radiators for heating buildings.
218,027.—J. A. Davenport: Reinforced concrete beam construction.
218,042.—H. Landmark: Manufacture of jointless floorings.
218,060.—H. T. Tallack: Surveyors' levels.
218,075.—E. B. Praceiq: Preparation of pulverulent fuels for the purpose of converting their ashes into hydraulic cements.
218,093.—E. Debongnie: Arched roofs.
200,519.—R. Faure and G. Bourrelly: Heating apparatus.
205,053.—M. Nola: Metallic joints for composite structures.
218,121.—M. Lombardi: Radiators for heating buildings.
218,127.—J. U. A. Ohlsen: Process for producing impermeable, strong, and acid-proof tubes, bricks, and other articles from diatomic earth.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ADWICK.—The Council has decided to build 300 more houses.—The Colliery Company are providing another 300.

ALTRINCHAM.—The Board of Management of the Altrincham Hospital are proposing to install a new X-ray department in their institution, estimated to cost £3,000.

ASHBURTON.—Steps are to be taken for the erection of a new head master's house at the Grammar School. The Devon County Architect is to assist the governors by the preparation of plans and estimates.

ASHTEAD.—Plans approved by the Epsom R.D.C.: House off Leatherhead-road, for Mrs. M. B. Jackson; bungalow, Links-road, Mr. W. Brown; house, Warren Estate, Mr. O. J. Humbert; house, Harriotts-lane, Mr. H. B. Hibbert; house, corner of Agates-lane and Barnett Wood-lane, Messrs. Paterson & Moyle; house, Harriotts-lane, Mrs. F. Lawson.—The Clerk was given power to deal with the acquisition of land in Barnett Wood-lane, where houses are being erected by Messrs. Paterson & Moyle, in order to widen road.—The Council agreed to steps being taken to acquire land to widen Ottways-lane between The Orchard and Whitehouse Farm.—The Council agreed to a larger drain pipe being laid to prevent further damage to cottages by surface water from Farm-lane.—Land has been purchased in Barnett Wood-lane for housing.

ASHTON-IN-MAKERFIELD.—The D.C. have under consideration the question of taking over the Old House site on the assisted housing scheme on terms to be arranged, or the disposal of the site for the erection of houses by private enterprise.

ASHTON-UNDER-LYNE.—The Sites and Buildings Sub-Committee of the E.C. has resolved to recommend to the T.C. that an application be made to the M.H. for power to borrow £8,080 for the purchase and alteration of Trafalgar-square School.

BANSTEAD.—The Epsom R.D.C. are to negotiate for land for widening Salisbury Court-road.

BARNSTAPLE.—It is proposed by the Devon C.C. to erect a pavilion at the Hawley Sanatorium, at a cost of about £2,000.

BEDWELLTY.—The U.D.C. propose building 16 houses at Argoed and 14 at Aberbargoed. The work is to be carried out by the Surveyor at a cost of £8,880 and £6,810, respectively.—The Council are to provide a cemetery. The Surveyor submitted an amended scheme for road widening at Bedwellty at an estimated cost of £300.

BIRMINGHAM.—The Birmingham Public Works Committee propose to erect 1,204 houses. The majority of the new dwellings will be of concrete, and will be erected on various sites at Billesley, Washwood Heath, Belcher's-lane, and Shortheath-road, Erdington.

BLACKPOOL.—Application has been made to the T.C. for the sale of a plot of land at Woodhouse Farm, Carleton, for the erection of a church.

BOLTON.—The Corporation is pushing forward with its scheme to extend the Town Hall building nearly to double its present size, and, in addition, erect new buildings in the shape of a crescent beyond the extension. It will cost over a million pounds, and as most of the property surrounding the Town Hall has now been acquired by the Corporation a start should be made early next year. The plans are being prepared by Messrs. Bradshaw, Gass & Hope, architects, 19, Silverwell-street, Bolton.—The Housing Committee have approved plans for another 55 subsidy houses in various parts of the Borough.—The E.C. has approved arrangements for taking over Lostock Industrial School to make it an open air school.

BOWLAND.—Plans are being prepared by the surveyor to the West Riding Education Authority for repairs and alterations to Grindleton-lane Ends School.

BRAINTREE.—The Housing Committee has received the sanction of the M.H. for the erection of cottages at Black Notley, Rayne, and Cressing. The Council decided to apply to the M.H. for sanction to the erection of a further 22 houses—eight at White Notley, six at Fairsted, and eight at Shalford—and also for the necessary loan.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Stirling.—BATHS.—The Miners' Welfare Committee have agreed to subscribe the sum of £7,000 towards the cost of providing the proposed public baths.

Drumoyne.—HOUSES.—The Housing Department of Glasgow Corporation propose to build 10 steel houses and a block of timber houses at Drumoyne.

Milngavie.—HOUSES.—The T.C. proposes to proceed with the erection of 36 houses on Section No. 2 of the housing scheme.

Torry.—SCHOOL.—The Aberdeen E.A. proposes to erect a new intermediate school; negotiations are taking place for a site.

Helensburgh. — REBUILDING. — Considerable progress has been made with the initial work in connection with the rebuilding of the West Church. Plans have been prepared, measurements taken, and schedules issued.

Edinburgh.—CHURCH.—Under the will of the late Mr. W. Crambe Reid, of Edinburgh, his trustees are directed to build a church on the south side of Edinburgh, to be named the "Reid Memorial Church." This has to be built from the residue of the estate, which may amount to £45,000 or £50,000.

Montrose.—CONVERSION.—The T.C. has approved plans for the conversion of a gospel hall in Mill-street to quarters for the nurses in the service of the Montrose Nursing Association.

Perth.—GRAND STAND.—The directors of the St. Johnstone Football Club propose to erect a grand stand on the Muirton site, and have now accepted offers amounting to £9,500 for the work.

HOUSING PROGRESS IN SCOTLAND

THE following figures show the progress that has been made in State-aided housing schemes in Scotland to August 31, 1924:—

	Completed.	Under Construction.
1919 Act	22,620	2,798
Private Subsidy Schemes.....	2,324	—
Slum Clearance Schemes.....	533	1,708
1923 Act	618	4,471
	26,095	8,977

Of the total number of houses completed and under construction under the 1923 Act, 1,918 are by the local authorities, and 3,171 by private enterprise.

Scottish War Memorial.

A memorial was recently unveiled at Beaumont Hamel to the 51st (Highland) Division. The memorial takes the form of a granite cairn, rough-hewn, 19 ft. in height, and surmounted by the statue of a Highlander. The total cost of the Highlanders' memorial has been about £8,000. The architect of the memorial is Mr. A. G. Bryett, A.R.I.B.A., London, and the sculptor, Mr. G. H. Paulin, A.R.S.A., Glasgow. Messrs. M'Donald & Creswick, Ltd., Edinburgh, are the contractors for the bronze work; Messrs. Garden & Co., Aberdeen, for the granite work; and Messrs. Soille Frères, Brussels, for the paving and building.

Change of Address.

Messrs. The Sunlight Enamel and Paint Co., Ltd., have removed to 31–32, Grosvenor-place, London, S.W.1.

The London Brick Co.

Messrs. The London Brick Co. & Forders announce a further interim dividend of 5 per cent. (making 10 per cent.) on Ordinary Shares.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.

lification. In dealing with the
sewers it is stated that "in
re deposits in sewers are much
more common than in this country, elaborate flap valves and seals are used in the house-connections in a number of cities" (p. 96). There are, of course, still a few sources of deposit left here as a relic of the past, but further information as to the elaborate flap valves on house connections would be interesting. It is customary in this country to use the same horizontal scale for plans and sections. Differing scales are recommended on p. 134, although on the accompanying diagram similar scales are employed. The suggestion that floats should be followed night and day for three or four days in order to test the flow of the tidal currents from an outfall sewer could only apply to a discharge in the upper reaches of a tidal river and should be so qualified. "Flight sewers" (p. 165) are not explained in the section to which cross reference is made (Art. 38). All manholes illustrated are circular on plan, British practice in general favours a rectangular shape, although many circular ones are built. The special combination manhole for storm water and house drainage sewers (p. 196) is an atrocity that is hardly likely to be copied here. The practice of ventilating a sewer into a flushing chamber (p. 200 and 201) is not a good system, and if the pipe is intended as an overflow it should be trapped. Catchpit-gullies of 500 gallons capacity or thereabouts (p. 205) are illustrated as being the normal practice. Nothing so large is customary here under any circumstances, and pot gullies are not referred to. Sewers and drains are recommended to be graded by stretching a cord vertically over the pipes (p. 264); the British system of sight rails is not referred to. The reference to rotary sewage distributors (p. 384) is very brief, as it is believed there is only one in America; on the other hand, considerable space is devoted to fixed sprays. The index is an extensive one, but there is so much in the book that it is not to be wondered at that there are a number of omissions.

The Designing, Constructing and Sewerage Systems and Sewage Treat-By A. Prescott Folwell, M.Am.Soc.C.E. (London: Chapman & Hall, Ltd.)

TRADE NEWS

The directors of Messrs. Bell's United Asbestos Co., Ltd., have declared an interim dividend on the ordinary shares of 6d. per share, being 2½ per cent. (actual), less income tax, on account of the profits of the current year.

The offices of Messrs. The British Pipeless Central Heating, Ltd., have been transferred to 57-61, Pershore-street, Birmingham.

Messrs. The Vulcanite Co., Ltd., inform us that the flat roof of the Nurses' Home at Reading, recently illustrated in *The Builder*, was covered with their patent vulcanite roofing, and the top surface finished with ½ in. of tarmacadam. The area covered was approximately 7,000 super ft.

New Methods of House Construction.

The committee which has been set up under the chairmanship of Sir Ernest Moir to inquire into new methods of house construction met recently in London. With a view to expediting their investigation the committee would be glad to receive as soon as possible any further proposals for new systems of house building or for new materials. All communications on the subject should be addressed to the Secretary, Mr. T. H. Sheepshanks, Ministry of Health, Whitehall, S.W. 1.

Building Trades Operatives.

At the resumed meeting of the National Federation of Building Trades Operatives at Blackpool, a resolution was passed asking that each society affiliated to the Wages and Conditions Council be recommended to give six months' notice to terminate the present agreement, with a view to setting up an agreement which would be more in accordance with the circumstances operating in the industry. It was stated that the bricklayers' and plasterers' societies had already given notice to do this. The notices will probably be tendered before September 29, to take effect on March 25, 1925.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

XVII.—No. 4262. OCTOBER 10, 1924.

OUR OLD BRIDGES

NOTWITHSTANDING the prevalence of what we may call a very sensitive sentimentalism in these modern days, we are still much bound in our public actions by the grosser forms of utilitarianism and money values. We permit a freedom of speech which s at long-cherished ideals. We note and control the deadly ers of selling cigarettes after 8 p.m., but we allow street c to develop the most serious dangers to the amenity of life. We allow food supplies to be exhibited and trans- d with no protection against the contamination of dust dirt—we strain at a gnat and swallow a camel. Thus we eminded with every fresh issue of the annual reports of Society for the Protection of Ancient Buildings that it h the greatest difficulty the work of that Society is carried ccessful results in the endeavour to preserve to the country ld traditional beauties by road, river and hill. The present t has to deplore two signal losses, but there is much we n danger of losing besides the more widely known and well rtised examples of ancient work. Who is there amongst who delight in beauties of the road and field who cannot memories of many a charming old bridge which in its ct setting of road, river, field, and trees, makes a picture 7s remembered with joy? Yet in the minds of thousands set great store by common sense and practical values, nore uncommon sense of line, tone, proportion and colour, he doubtful values of mere beauty do not count for much e the existence of an old bridge is concerned. How narrow, steep, how unscientific it is! How it interferes with the ess of the motor car, how needlessly expensive to keep in r! How completely out of touch it is with the guiding hts of modern life which insist on speed, luxury, economy ommon sense! You could hardly defend these old bridges ey fall before the juggernaut of modern progress, for their ant of good is only that they form the centres of pleasing es and keep alive something of our old traditions. We therefore, glad that the Society for the Protection of nt Buildings is directing attention to the danger of our many of the most characteristic and beautiful objects our roadways can show. There is always a chance of nent and interest being worked up about the loss of nent and well-known examples of old bridge building, ll over the country there still exist old bridges which are e mercy of local councils and with little or no public nent to speak out for their preservation. In some cases may be inexorable arguments for their destruction, but lieve that many might be preserved even if that involves ng them as by-pass ways over streams and making a new across at another point; they might at least serve for trian or light traffic, and all motor vehicles forbidden use. If the public feeling can be aroused to the value of iful things it may stem the tide of soul-destroying mies and mere dollar values. Of course this point of view e decried with much show of reason, but if we still believe fe is more than meat and the body than raiment we shall it that amidst all the really necessary needs of modern ss and modern improvements we still cherish our price- nd may we not say necessary?—heritage of beauty and

ny a charming rural scene would lose beyond recovery ef point and interest if it were robbed of an old bridge. akers of our old bridges builded better than they knew, hilst providing for practical necessities in the best way ould, were really endowing with lasting charm many an e spot in our countryside. Guided by a subconscious f values, in proportion and accent, they followed the of tradition in craftsmanship and detail so far as they would serve. Seldom, indeed, was any attempt made at purely ornamental effect, but ribbed arched soffits, quaintly spreading cutwaters, and varied arch outlines provided variety and interest to general outlines of great simplicity. All over the country from north to south and east to west our old bridges have given us a heritage of abiding delight, and we should see to it that this phase of building art may be treasured and preserved as far as practical necessities permit. That the march of progress must not be delayed we may fully agree, but by-pass roads, modern churches, great valley reservoirs, ferro-concrete bridges, and the like present-day developments should not be allowed to rob us of all the special values attaching to old values in traditional building.

Much might be said as to the protection of ancient buildings in relation to the efforts which are being made to secure it. Even now, in the report before us, we have a note of wonder as to how "it could be credited that any civilised community would tolerate such a deed" as the destruction of the old Court House at Barking. And further on we read of the destruction of the Star Inn and neighbouring houses at Bury St. Edmunds, with the remark that "it is indeed deplorable that this loss should have come about at the hands of a municipality." A warning is uttered against any undue feeling of security as to the fate of the City churches and the necessity is urged of constant vigilance in the matter. If such illustrations as those we give from the report before us do not convince people of the charm and value of our ancient buildings, and the importance of a society for their protection, no further argument would probably count. We can only hope that increasing support will be given to a society which recognises the great value of our ancient buildings and devotes so much effort of a purely voluntary kind to enforce and preserve this value. A merely platonic interest in its work is not enough, for the report says the work which lies before the society is altogether beyond its present capacity, and if the wastage of ancient buildings is to be stemmed, a considerable increase in members and funds must be immediately obtained. We have dwelt specially on the importance of preserving old bridges, but the efforts for their preservation are often lost for need of a scientific report by an engineer of recognised ability to show that the Society's suggestions were practical as well as sentimental, and that it is able and willing to spend money in defence of a beautiful and interesting bridge.

This is only one example of the Society's need for income. To give another though an allied instance on the same subject. When the Committee learned that the Ministry of Transport had asked the County Councils to apply for grants for the widening or reconstruction of their narrow or otherwise inconvenient bridges, it at once approached the Ministry and was sympathetically received. It was told, however, that the Ministry had not the means to make so full an examination into the archæological side of the question as it would desire to do, but that it would welcome information from this point of view from the Society. The Society's staff is barely able to cope with the work that is normally before it, and to find out what bridges were threatened all over England and then to discover which of these were valuable was clearly beyond its capacity; that is for any result to be forthcoming soon enough to be of use.

Lord Howard de Walden made a very pertinent allusion to the acquisition of treasures for our Museums whilst we are letting slip away from us valuable ancient records such as cannot be housed in glass cases. For ourselves we deplore the vandalism that goes on abroad, and yet slowly the streets of our towns and villages are being stripped of their local character and distinction.

NOTES.

Slow and Costly Building.

IT is so difficult to overcome the inertia (arising from various causes) which bars the way to improvement and progress, that we welcome any signs of help which promise to break it down. Such help is, we think, to be found in the attempt by Mr. Bromley to arouse architects to some action in the fight against slow and costly building. We hope our readers will find in his paper on this subject, which we publish this week, some stimulus to more definite action by the profession. Mr. Bromley says the "ca' canny" cancer is sapping the industrial life of the nation. The price per cubic foot of building is about the same in America as in this country, though wages there are about double. Is it not worth while for the R.I.B.A. to sift this discrepancy to the bottom? It is to be regretted, says Mr. Bromley, that Sir Henry Tanner's letter published in *The Builder*, April 11, 1919, was disregarded. In this, he advocated a thorough investigation with regard to the cost of building, and suggested a mixed commission of the R.I.B.A., the Surveyors' and Builders' Institutes, and the trade unions. Is it wise for us to fold our arms and wait for others to do something? What can be done about this ca' canny blight and the failure of apprenticeship (once the glory of England)?

Housing Solutions.

WE do not feel there is much room for optimism in recent solutions put forward to meet the housing difficulty. Such schemes, even though able to provide us with all-steel construction houses, at one a fortnight, may prove of uncertain advantage, for we cannot eliminate other considerations, the gravity of which does not appear to be sufficiently regarded. To build in tens of thousands houses which hold no quality of character, is surely not the only way to meet such an emergency. It would seem almost as though some paralysis had fallen over the wits of men, that we cannot find it possible to build in more attractive and becoming character. In any case, do not let us, if the machine is to replace the man, congratulate ourselves on having done much for the welfare of human life. We do not under-rate the urgent nature of the problem, but how it strikes a correspondent will be understood from the following suggestion: "Far better it appears to me than to surrender to the factory method would it be to subsidise directly the worker himself, and let him build his own house. Give the responsible workman, under suitable provisions, a sum of money, say, £250, and the land to build on, and let him make his own home. We do not find that large housing schemes prove less expensive; on the contrary, they are far more so. Such a scheme may not satisfy the theorist, but it appears that the alternative now offered is likely to be far worse than anything that the workman himself, with such an impulse directing his experience and practical knowledge, is likely to achieve." In any case, to eliminate, as is proposed, the skilled man as the solution of the housing difficulty, and to think that the "unsatisfactory output of skilled labour" is to be overcome by doing without him altogether, is not only mistaken but fraught with danger.

Work and Unemployment.

ANOTHER point of vi regard to housing i flected in the foll from a correspondei "There can be no doubt that behi the other problems and difficulties face us now there stands the dark sh of unemployment as a standing mena us all. No one with a spark of d manhood should be content to r a dole if there is employment to be Whilst the outstanding difficulty i way of carrying out the great ho schemes is the shortage of s labour, we are burdened with unem ment because the labour we so urg need is not available. Everyone is a that it is hopeless to expect we carry out the Government housing with the skilled labour which is avai If buildings could be erected largely out skilled labour a great part o difficulty would vanish. Here the is the opportunity for a new ty building, and demonstrations such have had during the last week have fore a vital interest."

The Minister of Health.

MR. WHEATLEY, Minister of Health, s ing at Birmingham o housing question, i ported as having attributed the sho of men and materials to insecurity had prevailed in the building indu and to have twitted Mr. Chamb with having done nothing to inc the personnel and material durin time as Minister, as though he hi had already accomplished the soluti both these questions, apparently re as to personnel on new apprentices. there are two sentences in his s

if correctly reported, are far more t to explain than the above state- as, according to the report, he said first place that owing to rent ion he was now in a position to ll advantage of the law of supply mand, whilst almost in the next e he said that by the legislation posed he would suspend the law of and demand as affecting the price ding materials. How are these atements to be reconciled one with the other? A restriction on rents, according to Mr. Wheatley, is no restriction on the law of supply and demand, whilst restrictions on the prices of building materials suspend that law. He went on to say that manufacturers and merchants by doubling output would be able to double profits without adding a penny to the price, and that may well be the case, but he did not explain how the restricted landlord was to make good his rent. We have always endeavoured to take an impartial view of the housing question, but it is difficult to do so when the Minister makes it a political question, as he did in his speech at Birmingham. Housing might well be left outside the political arena, but Mr. Wheatley in another speech even characterised a general election as "a class struggle."

Coal Smoke and Fog.

WITH the short and colder days of autumn and winter before us we may expect and shall no doubt get the usual fogs with which we are familiar at this time of the year, but whether they be vapour fogs, which are inevitable more or less all over the country, or smoke-laden fogs depends in some measure upon ourselves. The result of the general emission of smoke from chimneys is known to most of us, but in our familiarity with an evil we may lose sight of its extent. Lord Newton, who was chairman of the Ministry of Health Committee on Smoke and Noxious Vapours Abatement, puts the case with some force when he says, "Smoke is a national nuisance. It is injurious to health, partly because it pollutes the air we breathe, partly because it hangs over our towns and cities and deprives their inhabitants of the beneficent effects of sunlight. It affects seriously all buildings and all forms of vegetation. It is costly in many other ways—in creating fogs, for example, with all their concomitant accidents and delays, and in adding vastly to the expenditure on washing, lighting and decoration. And lastly, owing to the incomplete combustion of raw coal, it incidentally represents a considerable misuse and waste of our limited fuel resources."

Rowsley Bridge.

GENERAL NEWS

Professional Announcements.

Mr. F. Malcolm Burr, M.S.A., has removed to 30, Finsbury-square, E.C.2. Tel.: Clerkenwell 1553.

Mr. F. E. Wapshott, M.S.A., F.S.I. (formerly Chief Surveyor for the South-Eastern Counties at the Ministry of Health), has resumed private practice as architect and quantity surveyor at 139A, High-street, Tonbridge, Kent. Tel.: Tonbridge 360.

Mr. S. Lunn Whitehouse, L.S.A., has opened an office at 3, New-street, Birmingham.

Annfield Plain.

The design of Messrs. A. & F. Manuelle, Ltd., London, has been accepted for the Annfield Plain War Memorial.

The Surveyors' Institution.

The first ordinary general meeting of the Session 1924–5 will be held on November 10, at 8 p.m., when the President (Sir Edwin Savill), will deliver his opening address.

Brighton School of Art.

Mr. J. L. Denman, A.R.I.B.A., is giving, on Friday evenings, lectures on architecture at the Brighton School of Art. In each instance technicalities are avoided so that they may be comprehensible to the uninitiated.

Soane's Museum.

An interesting House and Art Collection is now open free to the public at Sir John Soane's Museum, 13, Lincoln's Inn-fields, on Thursdays and Fridays in October, from 10.30–5, and will continue open on these days in November, from 10.30–4.

"R.A." Railway Posters.

Three more posters of the "R.A. Series" have been produced by the London Midland and Scottish Railway, and will be exhibited at the principal stations on the system during the present week. These are "Warwick Castle," by Mr. Adrian Stokes, R.A., "Conway," by Sir David Murray, R.A., and "Coal," by Mr. G. Clausen, R.A., a further addition to the posters representing British Industries.

The National Gallery.

The collection of pictures bequeathed to the Nation by Dr. Ludwig Mond is now arranged at the National Gallery in Room XXVI, where the group of Wertheimer portraits by Sargent has recently been hanging. The works exhibited comprise the whole of Dr. Mond's Bequest to the Gallery, with the exception of the famous Mantegna "Imperator Mundi" and two panels by Cima.

British Commercial Gas Association.

Mr. John Henry Ellis is the newly-elected President of the British Commercial Gas Association, which has just concluded at Liverpool its thirteenth annual conference.

COMPETITION NEWS

Harrogate Infirmary.

The assessor, Mr. S. D. Kitson, has made the following awards in this competition:—(1) Messrs. Elcock & Sutcliffe, 21, Northumberland-avenue, W.C.2; (2) Messrs. Lanchester, Lucas & Lodge, 19, Great Russell-street, W.C.2; (3) Professor Beresford Pite, 19, Great Russell-street, W.C.2.

Dundee School Competition.

Mr. John Arthur, the assessor, has made the following awards in the competition for designs for the new advanced school in Blackness-road, for the Dundee Education Authority:—(1) Messrs. Maclaren, Soutar & Salmond, (2) Mr. J. O. Allan, Aberdeen, (3) Messrs. Allan & Friskin, Dundee.

Monument to Sir Wilfrid Laurier.

In this competition, a design submitted by Mr. Emile Brunet, a Montreal sculptor, has been accepted by the Canadian Government f memorial which is to be erected on Parli Hill, Ottawa.

From the Report of the Society for the Protection of Ancient Buildings.

16th-Century Court House at Ba now demolished.

Other Competitions.

Other competitions still open inclu following (the dates given are, first the sen date, and second the issue of *The Bui* which full particulars were given):—M Hall (May 1). Manchester Art Gallery (Ja Aug. 22). Concrete Cottages (Oct. 31; Se Christian Science Church, Southport (no se in date announced: Sept. 26). Barro Memorial Club (no sending-in date annou Sept. 26).

ACE IN THE BUILDING INDUSTRY

eading article last week we referred
l of peace in the building industry,
pparent want of confidence between
rties, the Federated employers and
who regulate the wages and con-
which peace and smooth working
an industry of enormous importance
allied interests. We suggested that
e which we should like to see estab-
not been secured by the direct
s of two of the principal parties
third and no less important party
ther two, *i.e.*, the building owner
l by the architect, should take some
cussions and decisions which affect
tally as anyone, and that for the
nother attempt should be made
an Industrial Parliament for the
ndustry in which representatives of
ctural profession should take part as
n some measure during the short
f the Industrial Parliament which
d in 1918, but which came to an
2 for reasons explained in our last
making these suggestions last week,
eating them in this issue, we do so
y conscious prejudice, nor do we
t this failure to achieve peace in an
such vital importance to the nation
e is due to any indifference to the
the industry, or that either the
ade employers or their operatives
in good will. On the contrary, we
y are just as anxious as anyone to
sting terms and conditions which
liable to violent alteration with little
ning. But the fact remains that
reason or other there is consider-
t in an industry which, consider-
rs of work which are before it, should
ago settled down to carry out that
because of the unsettled condition
ustry and because we believe that the
wner, whose interests are at least as
as those of any other party concerned,
represented through his architect,
ve suggested the resuscitation of the
rades Parliament, or the creation of
ody.

rom the letters and communications
ceived since our last issue, our sug-
been very favourably received, and in
the letters we print below we have
that there would be considerable
all events from the architectural
for a scheme for the creation of such

oubt that the Council of the R.I.B.A.
ort any well-considered proposals
g with the employers and operatives
joint Board, satisfactory to all
ld be established. We say this
architect, as the custodian of the
the building owner, knows that
fullest co-operation of all parties
the successful execution of building
e interests of all parties, including
d operatives, are bound to suffer.

EY TATCHELL, F.R.I.B.A., writes :—
upporting the views so admirably
your leading article of the 3rd inst.,
me that too much emphasis cannot
the necessity for the inclusion of
the Councils of the building indus-
nly is he, equally with the con-
the operative, dependent on the
his living, but he also represents
he building owner—upon whom,
aid and done, the industry depends
existence, although this fact would
ve been ignored throughout the
iations.

The architect, as an arbitrator, would approach any difference between the operatives and employers with understanding, and his intervention would, in my judgment, do much to bring about a better feeling.

Underlying the differences which have arisen is the discontent felt by the skilled operatives from the knowledge that the unskilled in other occupations receive better rewards for their labour and without the long apprenticeship and the purchase and maintenance of tools which is their portion.

MAJOR HARRY BARNES, in the course of an interview, congratulated *The Builder* on its entering into a search for a way out of the present unsatisfactory state of the building industry, and said that everyone was on common ground in the desire for peace in the building industry. He said that up to the present the architect had been no party to adjustments of wages and conditions, and any suggestion that he should share in these adjustments required careful consideration.

He held strongly the view that there might be much closer co-operation on the part of architect, builder and operative in promoting a high standard of craftsmanship and material in the industry.

In this province there was much ground for agreement and little room for dispute, and he would be very slow to take any step that would imperil the prospect of such a growing co-operation.

On the proposal that architects should sit as a joint board together with builder and operative for the purpose of reconciling differences as to wages and conditions, he was very doubtful. Such a position would not only be very onerous, but also very delicate, involving all the difficulties of arbitration without its decisiveness.

On the suggestion that the architect might act as arbitrator in appeals by either or both parties he was more inclined to look with hope.

The builder was at the present time prepared to accept the decision of an architect arbitrator on differences with the building owner as to the proper remuneration of the builder, and it might be that the operatives would be ready to extend the same confidence to the architect.

It appeared to him that if the Royal Institute of British Architects received a clear indication from both parties that they would favourably consider the establishment of a permanent tribunal for the settlement of disputes in the building industry consisting of, say, three architects, assisted by technical assessors, one from the operatives' side and one from the employers' side, it would no doubt feel the responsibility of the situation and with the greatest earnestness consider whether such a position could be advantageously to all parties and the industry as a whole taken up by representatives of the Institute.

Without some such indication he thought it hardly likely that the Institute would feel itself justified in initiating such a proposal.

MR. JOHN E. YERBURY, Lic.R.I.B.A., writes:—

SIR,—I have so often advocated the creation of a wider Joint Council for the Building Trade, and expressed the regret I have always felt at the failure of the Building Trade Parliament that I am delighted to find in your leader for October 3 an appeal for further consideration and for a scheme prepared by architects.

It is all too obvious that there is at the present time a complete lack of confidence between the two parties directly affected by the almost continuous strikes and lock-outs which have disorganised the industry. There is very little doubt that both sides are badly led, inasmuch as the leaders on both sides are inclined to be Napoleons rather than Solomons. In your columns—and others—I have constantly advocated a Conciliation Council or Joint Board, with representatives appointed by the two parties directly concerned and by the community they serve; and I have many times pointed out that public opinion can always decide the result of strikes or lock-outs and therefore should be well informed as to the facts. Absolute truth being unattainable, what is honestly held to be the truth will prevail; propaganda to gain the public support is resorted to by both sides, and justice is not necessarily done by a settlement brought about by this means; and where public opinion is long in doubt it is the long purse which wins.

In 1912 (I think) I first put forward the suggestion in your columns many times repeated since, that the most satisfactory Council for the building industry might be set up in the following manner, by the appointment of representatives from—

a.	Each of the Operatives' Trade Unions	say 12
b.	An equal number of Employers ..	„ 12
c.	An equal number from the Community appointed by Operatives ..	„ 12
d.	An equal number from the Community appointed by Employers..	„ 12

An independent Chairman appointed by the Minister of Labour.

I have suggested that representatives under *c* might be chosen by such bodies as the Working Men's College, Workers' Educational Association, the Co-operative Wholesale Society, Club and Institute Union, The Settlement Association, and other bodies which exist for the object of helping the workers, and whose sympathies are assured.

Representatives under *d* might be appointed by the R.I.B.A., the A.A., the Surveyors' Institute, the Institute of Civil Engineers, Institute of Mechanical Engineers, and other professional bodies.

A permanent secretary of first-rate ability, an expert in building matters, would be appointed, and a proper constitution drawn up.

Voting should be by secret ballot, and decisions binding for a fixed period.

If those most concerned would accept such a Board there would be no great difficulty in drawing up a Constitution; but until the principle of giving a voice to the long-suffering community has been approved by the employers and the operatives it is not much use the new united body of architects "coming forward with a properly considered scheme."

There are many who are anxious to help towards reconstruction if their help is acceptable to those most intimately concerned.

Alloa War Memorial.

Alloa War Memorial was unveiled recently by Earl Haig. The Memorial, on which is inscribed the names of 350 men of the town who fell in the war, is from a design by Sir Robert Lorimer, A.R.S.A.

Aberdeen Art Diplomas.

The governors of Robert Gordon's College, Aberdeen, had reported to them recently that the diploma of the Aberdeen School of Art had, on the authority of the Scottish Education Department, been awarded as follows: In drawing and painting (5)—Caroline E. Calder, James H. Gair, May Johnston, Marjory Lorimer, and Margaret Mitchell; in design and decorative art (3)—Ellen F. Finster, Lilia A. Marshall, and Dorothy Rose; in sculpture (1)—Jessie S. R. Johnston; in architecture (10)—Henry J. Brown, Arthur Campbell, James C. Clark, William Glashan, Frank A. G. Inglis, Robert S. Lawrie, Caroline M. Ross, Dorothy E. Sofer, W. C. Walker, and Thomas R. Wood. It was also reported that diplomas awarded in previous sessions to the students mentioned below, had, likewise on the authority of the Department, been endorsed in respect of the successful completion of courses of post diploma study: In drawing and painting—Andrew R. Summers; in design and decorative art—Winifred Mordaunt and Jeanie R. Reid; and in architecture—James S. Dawson and Alexander M. Stewart.

THE ARCHITECTURAL ASSOCIATION EXCURSION TO SPAIN.—I

BY A MEMBER OF THE PARTY.

To SEE Spain was even an ambition of mine, and the excursion arranged by the A.A. provided the final inducement of companions (in the words of Dr. Johnson) " whose acuteness would help any inquiry and whose gaiety of conversation and civility of manners are sufficient to counteract the inconveniences of travel in countries less hospitable than we have passed." It provided also the more practical benefits of a route selected, habitation secured, and the pleasing certainty that there would be someone with Spanish not restricted like mine to the word " manana." These expectations similarly reacting on some thirty other minds produced the 1924 excursion of the Architectural Association, of which the following diary is a bare and purely personal record.

September 11.—Paris. Found our party at the Quai d'Orsay Station somewhat shaken by a tempestuous crossing, but sufficiently alert to have seized all available corner seats.

September 12.—Irun, Spanish soldiers and Customs officials! Signor Mugurutza, the first of our Spanish architect hosts, appeared, and after a word from him we were slipped through the Customs without examination. The train picked its way among the Pyrenees, which do not adhere neatly to the border line, but sprawl over the country for fifty miles or so on either side. Any of the places we passed looked lovely enough to spend our whole holiday at, but the way of an architect is not among green pastures. Soon the country assumed an air more recognisably Spanish. Donkeys carrying panniers, and mules with citizens high perched on their sterns, contributed local colour; and small towns with white houses and ornate churches increased our assurance that we really were in Spain, till finally the name Vittoria painted upon a station settled the matter as effectively as that battle settled the Peninsular War. What is pardonable in Pepys may be considered irrevelant in an architectural diary, and I reluctantly refrain from a fully detailed account of our first Spanish meal, with its surprising variety of meats and its generous allowance of olive oil. Suffice it to say that this lunch, combined with the warmth of the train, introduced many of our party to the charms of the siesta.

The Ebro was crossed and another landmark reached—Burgos, with its cathedral plainly visible. The west front looks somewhat spiky and deficient in scale, but we never had an opportunity of examining it, or the town, which had a most attractive air. Thereafter valley succeeded valley, each bounded by hills and each tawnier and barer than the last as we approached the bare plateau of Old Castile. Now and again small woods of umbrella pines appeared, and, where irrigation existed, a few vines, but in general the landscape had almost the effect of a desert, and an occasional distant town or village had in the clear air a strangely unreal appearance. Farmhouses or cottages there were none, and apparently cultivation, if it exists, is conducted from the villages. At Medina the beautiful brick-built Castillo de la Mota presented itself to our view, and later, when the sunset had turned the whole landscape into a sea of red and gold, we espied Segovia. A moon almost at full rose from behind the Sierra, and a great enchantment fell upon us.

Then Madrid, greetings from Signor Gatierrez and other gentlemen who were later to prove the extent of their kindness, a flash-light photograph, and a long drive through the streets of a strange city. Finally the Residencia de Estudiantes was attained, dinner (at 11 p.m.) eaten, and after a stroll in the moonlight we retired to bedrooms of monastic simplicity and impeccable cleanness.

September 13.—A free day! The Residencia, with its red-brick walls and broad eaves and green tiles, looks charming in the brilliant sun, as does Madrid with its wide tree-planted boulevards. To the Prado Museum, where a feast of Velasquez, El Greco, and Goya awaited us. The variety of Velasquez astonished one. Las Meninas and the Philips I had anticipated, but not the joyful Los Borrachos nor the exquisite little landscapes. Goya, too, delighted me; but El Greco I failed to comprehend. Madrid is very much a modern city, and it is quite easy to avoid seeing anything of it older than the eighteenth century. A system of parks and boulevards lies to the east, and another to the west, and towards these the most important streets radiate from the central Puerta del Sol. By means of irrigation the trees that plentifully adorn the boulevards retain their freshness even in September, and, thanks to these and to the clear air and brilliant sunshine, the best parts make a brave show. It must be confessed that few of the modern or semi-modern buildings show a very high standard of architectural merit, but there is nothing petty or timid about the building projects, and new constructions seem to be plentiful. We strove this day to enter into the inner life of the city by attendance at cafés. Shoes are immediately " shined " when one sits down, so that in Spain, apparently, your tippler is revealed by the lustre of his feet.

September 14 (Sunday).—Up betimes, and by train to Alcala de Henases, which lies to the north-east—no distance by the map, but the train makes much of it. We were met by the Mayor, who in person conducted us to the ancient University, which once boasted 12,000 students—more than the present population of the town. The façade of the college is delightful in its golden-coloured stone, with baroque windows and doorway. Sad to see so much of it mouldering to a ruin. The lecture hall has a low gallery and a wall pulpit and coffered ceiling, both richly coloured. Churches there were in plenty—the little chapel of the University with a Moorish ceiling in wood; Sta Maria, with a curious curly Gothic vault; Sta Magdalena, in rich Baroque; and the fine collegiate church, known as La Magistral, now being rather painfully restored. The finest building is the old Palace of the Archbishops of Toledo. Its patio, surrounded by a two-storied arcade, has exquisite detail, and there are handsome rooms within —over-restored alas! Not yet fully equipped with the steel legs and rubber neck of the complete tourist, we returned to Madrid wearied, but not without having first raised our voices in a shout of " Viva Alcala " to the Mayor, who had nobly waited with us for the train a whole hour.

September 15.—Toledo is a large programme for a single day. It seemed so before we started; much more so when we had finished. There is something terrible and barbaric in its setting. The yellow Tagus flows in a deep gorge round the rock on which it stands, and all around lie bare sun-baked hills. A narrow bridge takes us across, and we enter the labyrinth of narrow streets by a Moorish gateway in the walls. Jews and Romans, Goths and Moors and Christians all have left their mark on Toledo. The last-mentioned have left in the cathedral the greatest monument that the city possesses, and it is in many respects the finest in Spain. Hemmed in as it is by buildings, it is difficult to get a satisfactory view of the exterior, which reflects the long period of nearly three hundred years during which building went on. Most remarkable eyes was the effect of vastness prod the lofty double aisles, almost equal selves to the nave of some English ca The choir and high altar, enclosed in Spanish cathedrals, have the appea buildings within a building. Their is dazzling, and the brilliant light fall the magnificent series of stained-glass adds colour of the most gorgeous kind more than anywhere, one derives pression of the wealth and power of the in Spain. Several churches of Tole originally mosques or Jewish syn Santo Tomé is an example of the fi Santa Maria la Blanca of the seco horse-shoe arches and arabesque show clearly enough that it was Moorish workmen, and the strange which were added by the Christians interesting than attractive. The ex the convent of San Juan de Los Reye a very interesting composition with ornamented octagonal lantern. The storied cloisters are most ornate and vitality, but the interior of the c scarcely as fine as we had expected. interlude from sight-seeing we enjo hospitality of the Mayor of Toledo, ceived our party at the Ayuntamient Hall), and as an additional relief prevailing ecclesiasticism we enjoyed to the most charming house of El Greco contains a great many of the smalle of that master.

September 16.—To avoid congestion mind, another " free " day has been us in which to see a little more of The sixteenth-century bridge of Sego pleasant Plaza Mayor and the little church San Justo were the best th saw; but after lunch it was announc we were to visit the royal palace at vitation of King Alfonso. The pala sound, if not altogether inspired exampl eighteenth-century architecture, and effective when seen from the low which falls rapidly away on the wes interior is almost never accessible, were greatly favoured in being allowe it in its entirety, for many of the ro magnificent. Innumerable tapestries the walls, many of them after Goya, Camara de Girardini stands out as on most delightful rooms I have ever s has a ceiling of porcelain in a baroque manner, and walls of richly dered silk. After walking through miles of apartments our flagging energ revived by a royal tea and a few speeches were made on both sides.

September 17.—The main party sta early for Segovia, proceeding thither but a small group who had dance morning revolted and took a leisurely train direct to Segovia. I understand so doing we missed some very fine an sive architecture and scenery, but at we arrived fresh and in proper mood ciate the charm of the place. It is set amid surroundings that are more fe friendly looking than most of the Spani and with sunset the naturally red colo landscape assumed marvellous tints. evening there was full of pleasure as we acquaintance of the aqueduct, the and the little square full of soldiers an

THE IMPERIAL COLLEGE OF TROPICAL AGRICULTURE, ST. AUGUSTINE, TRINIDAD

THE various illustrations which we publish this week of this college are from the sketch designs and working drawings for the College, prepared by the architect, Major H. C. Corlette, F.S.A., F.R.I.B.A. The perspective view was drawn by Mr. H. Chalton Bradshaw, A.R.I.B.A., and the model from which the two photographs were taken was made by Mr. J. B. Thorp, of 98, Gray's Inn-road. This model, with another of the sugar factory now being erected, is exhibited at Wembley, in the West Indies Pavilion. The north wing only of the College is being built at present, and will be completed this year. The long elevation for a comprehensive scheme is merely a preliminary study, suggesting a method by which the north wing now being built can be extended if required to provide for future needs.

Both the general plan and the elevation of the north wing have been revised since the preliminary designs were prepared. Strict economy was an essential condition to be observed in working out the plans and external elevations; and in accepting this requirement, the endeavour has been to rely upon practical planning and structural essentials for the production of any architectural quality. Tropical conditions of climate and the purpose for which the building was required were, therefore, allowed quite freely to dictate what the structural and architectural form might be without regard for preconceived ideas of archæological "style."

The first necessary condition to be observed was to keep the building indoors as cool as possible. Conditions of cost did not permit the provision of galleries or verandahs, on the north and south ends. But these parts will be sufficiently protected by other methods. The need for a free movement of air through the building was met by exposing all the laboratories and class rooms to the prevailing east winds. This involved a building with as much of its length as possible spreading north and south, with open galleries on the east and west fronts. These galleries are a practical necessity, but they also have a definite architectural value by giving variety to the building which grows naturally from the changes produced by contrasting those parts in high light with those in more or less deep shadow. The projecting portions in the centre, and on the north and south, should also help in the same way. Structurally, the building is a simple application of the use of supporting posts and beams, carrying the floor and roof slabs, with necessarily much repetition. All the work is being executed in reinforced concrete. The building, when completed, will be left as it is to bleach in the sun, after the removal of the shuttering. The cornice is an essential structural member of the building, and not only an architectural device. It forms part of the roof slab which is carried out to overhang the vertical line of the walls and piers, and provides a deep shadow down the external surfaces. It is supported underneath by small cantilever beams which run out above each of the piers; and between these another light beam is used to connect with the cantilevers and, at the same time, produce the outer member of the cornice itself. The flat roof is asphalted and whitewashed. There are practically no outer walls as such. The whole space between the piers is occupied by steel casement windows, or doors where required under the galleries, and teak louvres, which, in most instances, are made to be movable. Inside the casements, behind the glass, where no galleries occur, provision is made for hanging Venetian blinds made of corrugated aluminium slats. These will give a necessary control over the amount of light admissible at certain times of the day, and reduce what is known as "sky-glare." With the various precautions indicated, it may be said that the aim has been to provide what might be called a practical educational workshop, under tropical skies, in which a maximum inducement to mental activity is to be encouraged by conditions that may, it is hoped, be accompanied with a minimum of physical difficulty.

The local river gravel and sand used for the concrete with English cement is already taking a greyish-white colour, something like Portland stone. This will help the general colour scheme in view by effectively aiding the clear definition of lights and shadows. Other elements of colour will be introduced by the with their panes of glass, and the louvr The steel frames of the windows an and also the Venetian blinds, will be green. The teak louvres, having suff naturally in their composition, will b they are, and not painted. In the cornice and sill courses, and the caps a of the piers, a little variety of colou vided in detail by the use of narrow bands.

The planning of the building has be as flexible as possible, so that any e of the main structure if required can b provided for and any re-arrangement internal accommodation adopted as demands. The spacing of the piers, e the west projecting block, follows a dimension, so as to reduce costs, simp construction and calculations for s and concrete, and the cutting of steel the required lengths. The partitions the several class rooms and laborato removable. This will facilitate the in the size or allocation of rooms, or the of bench fittings, that may become n as the use of the College develops a requirements become apparent. All the tory drainage has been arranged to m probable future needs, so far as possib necessary channels and "falls" fo drains are provided between the st beams in the floors. The beams are tr coupled or doubled beams, so that n tural part of the steel in them could be if any acids did succeed in getting be channels.

COST AND SPEED OF BUILDING

nteresting innovation in meetings of tural societies took place on Tuesday, r. A. Nelson Bromley, F.R.I.B.A., read before the Nottingham and Derby tural Society and the officials of the Federation of Building Trades Opera-

id some recent articles in the *American Evening Post* had encouraged him to the important subject of "Slow and Building." The following was taken eading article in that paper for July 26, Britain is in a bad way and there is in blinking the fact. . . . The shortage may go from bad to worse an anyone now cares to predict. . . . *don Spectator*, which is not given to ate statements, declares that it is a scandal, and constitutes a national And yet it is men more than money r the most formidable obstacles to the ousing of the British workmen. . . . neless cobbler has the homeless brick-hank. . . . The number of persons in the building trades is smaller by han it was in 1913. This is not due to emand for labour, but to the oppressive exercised by Building Trades Unions number and ratio of apprentices per- be enrolled. . . . These arbitrary ns have lately been somewhat relaxed to any decisive extent. . . . The ors and the profiteers in building are tarred with the same brush."

he visited the United States in 1913 the price per cubic foot of building t the same as in this country, and that ges about double in America. His Mr. Watkins, who had this year from the States, practically found the ng.

sted the Royal Institute of British s would sift this discrepancy to the It was to be regretted that Sir Henry letter published in *The Builder* of 1919, was disregarded. In that letter ated a thorough investigation in regard st of building, and suggested a mixed on of the R.I.B.A., the Surveyors' n, and Builders' Federation and the ons. He sincerely hoped, however, Royal Institute would now take up ct seriously, for he was of the opinion vital importance to this country.

cessive cost and slowness of building his opinion, from various causes:—

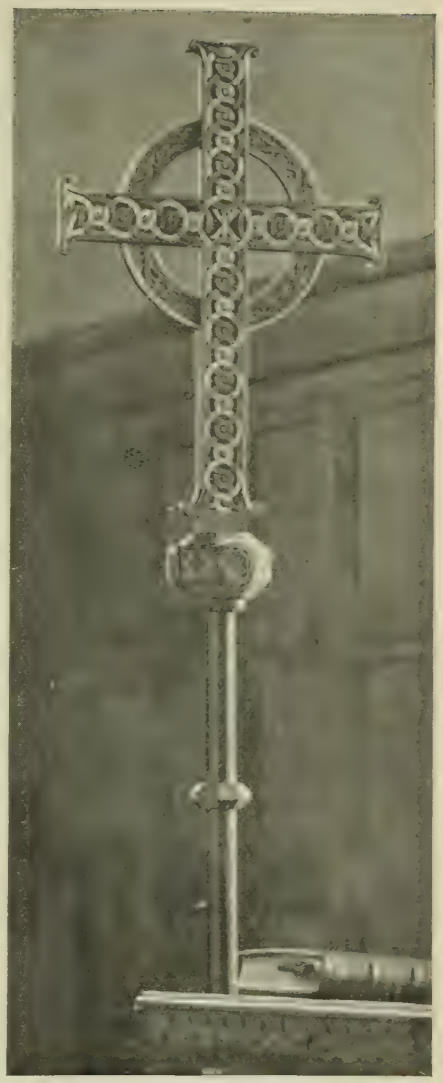
client frequently did not give the sufficient time to prepare his drawings. rican generally took twice as long to is drawings as we did, and in conse- uilt with astonishing quickness, thus is client unproductive capital and the disturbance to business, if they ling additions, to a minimum, and also g loss and inconvenience to adjoining The question of all fittings and should be settled by the client before rawings were completed.

architect must have all details pre- re quantities were taken out, and press upon the client the importance g estimates from builders who had on for carrying out good quick work. money, and if the work was carried a low estimate might prove the most he end.

builder must have the best machinery ting his work. He must treat his and remember that within reason it much a question of wages but of good, quick workmen. Some clients refused to enter into contracts subject s.

manufacturer of building materials ember that excessive prices bearing excessive profits, restricted the use of factures, and that good profits could ith a larger output at lower prices. st of some materials used in building now tended to reduce the standard of new buildings so that cheaper materials had to be submitted.

(5) The workman must give of his best, and he would get better wages. The slowing down of labour was not only dishonest, but it produced unemployment and increased the cost of the workman's own living. The serious nature of the limitation of output could be understood from the following particulars given him from a trustworthy source:—A considerable number of houses were built in 1912, and again in 1920 similar houses were erected by the same builder. It was found that the number of hours taken by bricklayers and labourers in 1920 was practically double the number of hours taken in 1912. He must say, however, that many men had of late worked exceedingly well for his firm, and he felt sure that if architects would take the workmen into their confidence and point out to them the serious results of slowing down labour much good would result.



He again quoted from the *Saturday Evening Post*, July 19, 1924:—"A fundamental reason for a good deal of the British unemployment, for which there is no legislative remedy, lies in a stiff-necked trade unionism which, with its limitation of output fetish has done as much to prevent a return to the industrial normality as the dole. This, coupled with the strike, has contributed largely to the industrial plight in which Britain finds herself. . . . Not only is the British worker slacking on his job, but once at work, he is obsessed by a curious fear that someone else will get that job. . . . The decline of the apprentice system, once the pride and joy of British industry, is a startling revelation of what seems to be an impairment of the British productive mind. . . . In any analysis of the British business position you encounter on all sides the uncompromising fact that the normal high cost of production is a disturbing factor. . . . Hence, one fundamental cause of unemployment is that the products of British industry are too expensive for an impoverished world to buy."

The following was an extract from the book entitled "From War to Work," which gave the American point of view, which was exactly contrary to unfortunate English methods:—"We are not going to have the trouble here that Britain had with restriction of production. . . . There has not been any restriction on output for over 30 years in America. We, in the United States have followed an entirely different policy. . . . We say to the employers: "Bring in all the improved machinery and new tools that you can find. We will help you improve them still further and we will get the utmost product out of them. But what we insist on is the limitation of the hours of labour for the individual to 8 per day. Work two shifts if you please or work your machinery all round the 24 hours if you like, with three shifts, and we will help you, but we insist on the normal working day with full physical effort. We will not agree to that over-work, producing the poison of over-fatigue which destroys the maximum of production, undermines the health of the individual worker, and destroys his capacity for daily industrial effort."—[Mr. Samuel Gompers, President of the American Federation of Labour, representing 2,000,000 workers, in an interview on Labour and Dilution. *The Observer*, July 8, 1917.]

It should be remembered that our own Prime Minister had recently expressed himself opposed to the limitation of output, which coincided with the views of Mr. Gompers. How was it that the leading men in County Councils and Corporations did not also openly protest against this ca'canny abomination, which was apparent to the most casual observer? If the erection of industrial buildings was slow and costly and Government and County Council and Corporation works were equally so, rents and especially rates, added to the overhead charges of both manufacturer and shopkeeper, and the building trade worker and the architect must pay more for rents, clothes, food, and even amusements, in consequence.

He was distinctly of the opinion that the architect might do much good in discussing and explaining to the workmen the difficulties they had to face. It must be remembered that the architect found the work before the builder, and he knows from experience that slow and costly building was the great factor which prevented prosperity in this important industry, and if the workmen only knew how much work was abandoned by clients owing to the cost and slowness they would join with us in speeding up work by all possible means.

If there were only one building in course of construction in this country there might be something to be said for slowing down work and employing as many men as possible on that one job. But if building were cheaper and quicker more industrial and commercial work would soon be forthcoming. There is, of course, a great demand for workmen for housing schemes, but that does not assist manufacturers or commercial men; in fact, it only added to their overhead charges and made it still more difficult for them to compete in the markets of the world. The housing of workmen, however, must be provided, and the only way in which they could assist was in speeding up work to the utmost. He thought he had said enough to suggest that the architect was the right man for approaching this difficult subject. The architect was the first to move in a building enterprise, he had no direct interest in the profits on labour, and above all he was free from the blighting influence of party politics.

Imperial College of Tropical Agriculture, Trinidad. A description of the Imperial College of Tropical Agriculture at Trinidad is given on p. 550. Major H. C. Corlette, O.B.E., F.S.A., F.R.I.B.A., is the architect.

Miners' Welfare Institute, Ilkeston. The plans of this building explain themselves, but the large hall and the rooms in connection with it on the first floor are being designed so that they can be used independently of the Institute, separate entrance and exits being provided. Slipper baths are provided in the basement for both men and women, together with dressing rooms in connection with the recreation grounds which are at present only partially completed.

The building was officially opened on the 13th ult. by Sir H. Dennis Readett Bayley.

The chief contractors were Messrs. D. Roberts & Son, of Ilkeston; whilst the heating and ventilation were carried out by Messrs. Young, Austin & Young, of Leicester; and the electric lighting by Messrs. J. W. Furse & Co., Ltd., of Nottingham. The recreation grounds are being carried out by Messrs. W. Barron & Son, Ltd.

Mr. H. Tatham Sudbury, M.S.A., is the architect.

St. Philip's Church, Rugby.

This church has been built on a restricted site and, as is usual in these days, with limited funds, which placed the proposal in the category of mission churches. The design attempts to continue the tradition of English plan with the substitution of authentic brickwork for the characterless brick Gothic which has served this purpose so long. Churches have recently been built in the true tradition of Lombardic brickwork, but the present design sought to avoid an altogether exotic architecture. The compromise seems to have been a success for the building has attracted rather than repelled worshippers.

The walls are faced with small hand-made red bricks laid with a wide unstruck joint, and the whole of the interior is of plaster set with a felt-faced float for distempering. The "Italian" hand-made tiling of the roof is c scissor-trussed rafters which form t work carrying the plaster barrel ce this device principals were eliminate walls kept low.

Heating is by low-pressure radia ventilation by baffled inlets behind the and by outlet gratings in ceiling ope cross-ventilated roof space. Artificia is by inverted reflectors on the indirect

[*Continued from page* 520)

BY W. R. LETHABY.

FIRST AND SECOND WORKS OF HENRY III.

FIRST WORK EXTERIOR.

The north front has been separately discussed, but in examining the Chapter House we have seen that the influence of Amiens Cathedral is plainly evident there also, especially in the

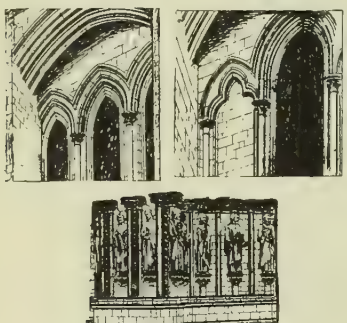

FIG. 7.—NORTH FRONT (S. Weatherley).

sculpture. If we could see the Westminster portals there is no doubt that we should find the Apostles on the jambs, directly imitated from those at Amiens, each with his significant emblem. Even in late reports of them they were recognised as Apostles. (Fig. 7 is from Mr. Weatherley's drawing of Sir G. Scott's proposed restoration.) We have a record of the mouldings of the great central doorway in a sketch by Carter, now at Westminster, Fig. 8 F. Scott followed the evidence in the main correctly from the decayed *original* work, but made some modifications. On comparing the "restoration" with Carter's sketch we can arrive at the original form. One of the arch orders had a great hollow for carved work, doubtless of little figures in interlacing foliage as at Lincoln, or of figures under canopies like the figures of Virtues and Vices of the Chapter House door at Salisbury —from the jointing Scott thought the latter. I gave an extract before from a letter of Mr. Baker King, who worked for Sir G. Scott, but print it here more fully as every morsel of evidence on these wonderful porches is valuable. "I have in my note book some sketches and dimensions giving the sizes of voussoirs of the arches which were carefully followed in the new work. Much of the old work, where it had partly perished, had been reworked in the eighteenth century. The orders of the arches which had had carving were reduced to this form (A, Fig. 8), the carving having been cut away. The Purbeck marble abaci of the caps, which had been something like this (B), were reduced to (C). The neckings of the capital also extended along the jamb splays thus (D) not dying against the splays. If you have been up to the stone roofs of the portals you will have seen that a considerable portion of the ancient stone slopes remains. The pitch of the gables was given by several of the stones which had the intersection of the two slopes. I do not think that any of the Purbeck marble shafts remain. The jointing of the corbels for sculptured figures inside the porches gave the dimension for these features, but all had been worked off flush [E, but part of one old corbel remains]. The sunk panels in the tympana of the inner arches had all been pared down" (September 2, 1907).

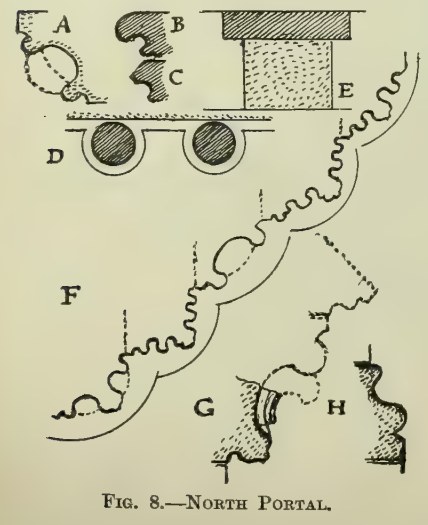

FIG. 8.—NORTH PORTAL.

The "sunk panels in the tympana," just mentioned, must mean the series of cinquefoils in circles which form a series of medallions. That these had been reworked is confirmed by a sketch of Carter's which shows them thin and poor. I have no doubt that these circles originally contained little sculptures as at Amiens and that there is an echo of them in the doorway at Higham Ferrars.

Even the small details and the continuous base mouldings and neckings (Fig. 8, D) were taken from the portals at Amiens, and they are found again at Lincoln, which was derived from Westminster. Further, the record that the abacuses of the capitals only were of marble shows that the capitals themselves were carved, for all moulded capitals were wholly in marble. The late Mr. William Brindley informed me that fragments of the Purbeck marble shafts had been found and these were of a scarce reddish tint, as if they had been specially selected. Fig. 7 shows what Sir G. Scott thought the details of the windows above the porches would have been; the suggestions I made in 1906 agree entirely except that Scott rightly put carved capitals instead of moulded. In the actual "restoration" as carried out the forms which had come down to our time were altered. The remarkable gable tracery (Fig. 1) was destroyed 1884-90.

What may be called modern repairs in the church began in 1600. (See B.M. Add. 34195, f. 14 and 16.) Dean Andrews established a fabric repair fund. Hackett says of the next Dean, Williams, "he found the church in such decay that all who passed by shook their heads at the stones which dropped down from the pinnacles. Therefore he took care to strengthen it. He began at the south-east part, which looked the most deformed with decay, because of Henry VII's Chapel, which was tight and fresh; the north-west part also, which looks to the great Sanctuary, was far gone in dilapidations. The great buttresses, which were almost crumbled to dust with the injuries of the weather, he re-edified with durable materials and beautified with elegant statues (among whom Abbot Islip had a place) so that 4,500 pounds were expended in a trice upon the workmanship."

Norden, writing about 1600, says of the pinnacles of the buttresses that "many through antiquity have lost their form." Hollar's print shows the buttresses of the chapels without pinnacles, and the whole east end looking very bald.

The exterior of the ring of eastern chapels has been terribly pared down and put into a modern casing that it looks like a convict's garb compared with what its ancient, graceful beauty must have been.* However, it is better than anything we could now substitute for it.

* In the books of accounts for work done in Wren's time, from 1698, the renewal of the external masonry can be followed in detail in items like this:—"Taking down 4 pyradmids" (pinnacles). "416 feet supl. of axing pointing and cleansing old Reigate ashlar at 4d. a foot." Wren last signed accounts 1721.

A photograph of the chevet of Reims Cath will help us to make an imaginary restor The chapels at Westminster still so disti echo those of Reims that we may be con that parts which have been superseded followed the great prototype (Fig. 6). At the great pinnacles of the buttresses co statues of a choir of angels in niches. eastern buttresses at Westminster are u dry, drab and dreary, but those to the w the transept have niches for statues look as if they must have been derived Reims, and in that case it would be th the buttresses of the first work.

Now in Hatton's *New View* (1708) remarked of the Nave: "It was on the o adorned with the statues of princes who tributed to this building. They were in niches in the said 18 buttresses betwee cross aisle and the west end of which not eight remain on both sides." The tra end is then described, and the author "There were also several figures on the tresses on the east side of the church, buttresses in the reparation thereof are r plain; but though that grand enemy of b Time has somewhat defaced her ex features, yet there remains not a few ma her outward gracefulness."

The windows of the apsidal chapel obviously like those of Reims, and the butt are similar in having their lowest slop continuation of the window sills. The bu slopes were in a smooth slanting plane at and this, as we shall see, seems to have followed at Westminster. At Reims the window arches are studded with foliage this, I doubt not, was so also at the A we find such arch decoration inside the transept doorways and elsewhere. The hollow mouldings of the chapel wi suggest such carving.

The exterior of one of the original wi of the apsidal chapels has been preserv a sheltered recess at the S.E., next to VII.'s Chapel, together with its six-foil It has been shorn of its mouldings outside within even the carved ends of the cusps re This window is a treasure; it assures us indeed is plain enough from the blank tr within the chapels that the lower sta windows in the first work really had thes foiled roses. Remembering the insisten rose decoration throughout the first wor may not doubt that this tracery form actually seen and understood as a rose. shall find that exactly the same form on a small scale was repeated in paint on the as a rose decoration. The jointing of th window, which must have been one of the first erected, looks a little uncertain an perimental. Some decayed pieces of c ends of cusps remain among the collecti loose fragments.

The inner part of at least one of the trian

FIG. 9.—FROM NORTH-EAST DOO

orium windows still remains, except for the ing; and the ancient ironwork of the foiled les also, I believe, exists in several cases. he clerestory windows of the first work have -foiled circles and these are guaranteed in eral cases by old ironwork. Some portions of t appears to have been the ancient cornice e been found (Fig. 8, G). Doubtless it was of typical French fashion, a deep course with ow moulding studded with carving, and a lower drip course above. Evidence for this been carried on in the series of renewals. the wall plinth, a French form.

of two chamfered orders. The higher ends ne arches were supported by large capitals, I was told many years ago that the ends of e of these, of Purbeck marble, had been found e recasing the apse. Fragments of the beck shafts were also found in the walls. ne doorway entering Poets' corner, together the walling about it, is the largest piece of ent external work that remains. It is a panion to a similar door on the east side of north transept, which is also largely ancient, ough unhappily it went through the process arned restoration, so that it is difficult to what is really old. Some of the carved —one of the French foliage type (Fig. 9)— in, and enough of the carved arch to show such carving existed. The Poets' Corner way has nearly lost its capitals by decay. ketch (Fig. 10) from one of them is largely de up" but it gives the style. These two rnal doorways with their original carved tals are most precious. Together with the ence as to the great portals given above

Fig. 12.—Capital by Door to Cloister.

and the carved caps of the windows in the interior, they show that the door and window capitals of the first work were carved and not moulded

The south doorway into the east walk of the cloister decayed very rapidly until late years, when a coating of lime did some good. It has diapers of the Amiens fashion up the jambs with roses studding the moulding, rounds of foliage in the arch, and crowned heads as label terminations. The carved capitals were of the foliage crocket type. Some notes of these details are in Collings' sketches (1842) at South Kensington (E 4086), and earlier records by Carter carry us back to 1795. Fig. 11 was made in 1910. Fig. 12 is a capital near by, with one from the doorway also.

The vaults to the three northern bays of the east side of the cloister are the earliest built, and with their plastered cells and small bosses they are of an earlier type than others in the church.

The south transept as recased in Wren's time was restored into correct sham "Gothic" fashion in the upper part about 1870, and a new south rose was inserted about twenty years later. Some old photographs show the pleasant Elizabethan cappings to the turrets as still existing (Fig. 2). Repair of the lower part of the transept was undertaken about 1913. The casing —"flagging," as Wren called it—had become detached from the solid walls in big patches, but it was decided to repair the work as it was, making no vain attempts in sham Gothic. I have a note before me, dated July 5, 1916: "The repair of south transept has reached the buttress on the left of 'Wren's arch.' There were four weatherings to the buttress at the height of coping of cloister, the slope being continuous; the courses are 7 : 8 : 9 : 6 in.

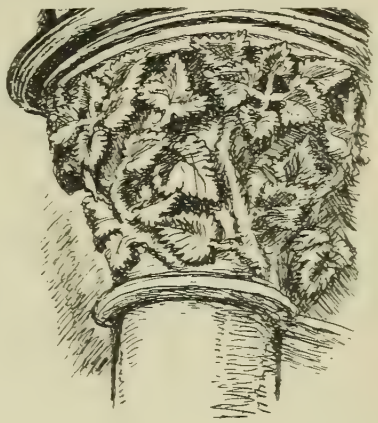

Fig. 13.—Naturalistic Foliage (Interior).

There was another slope of two courses at level of springing of Wren's arch and another near the level of triforium windows. Some 30 ft. in height of the buttress face, which was 5 ft. 8 in. wide, was exposed at one time. The work was very closely jointed in courses, varying from 6 to 11 in. The face of the slanting wall of stair turret also exposed; original face still remains in the recess under Wren's arch, which was built to carry the casing of the buttresses."

October 24, 1917: "Repair of south transept still going on notwithstanding everything! The splay angle of stair turret was exposed for a great height showing original, much decayed face. The courses are very narrow, some only five inches, and few more than eight inches. The joints white lime putty and very thin. The stair windows had probably been narrow slits originally. [A sketch of one in the turret by Poets' corner, by Carter, shows it six inches wide with a circular enlargement at bottom like a castle loop]. We have now seen a large amount of the original face of this transept." The facing

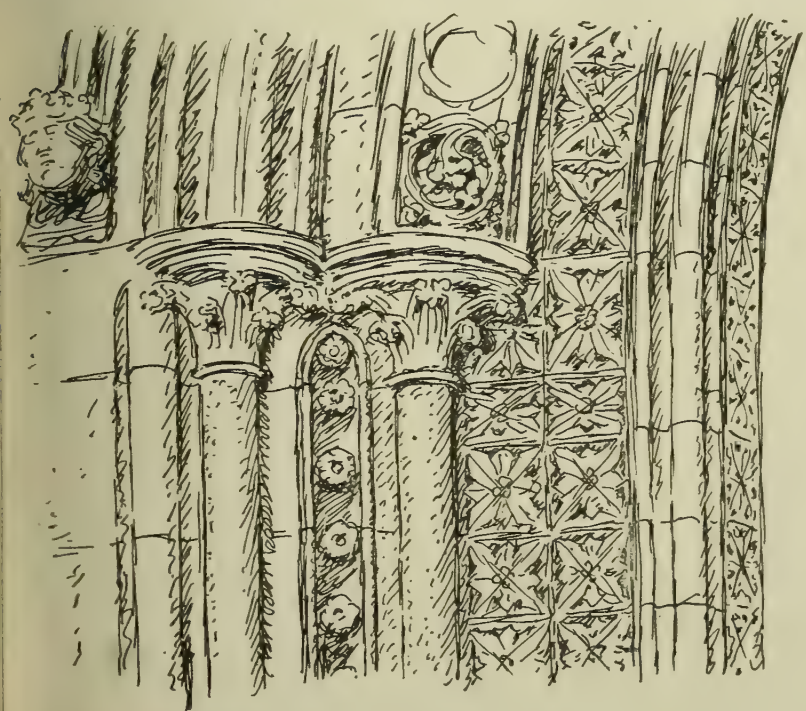

Fig. 11.—Jamb of Door to Cloister.

Fig. 14.—Falcon Capital (Interior).

courses of Chapter House and those which remain by Poets' Corner entrance are equally narrow. The stone was very white and the new building must have been bright and fair even before it received the usual protective coat of wash.

A lantern tower was designed as part of the first work and actually commenced. The squinch arches across the re-entering angles

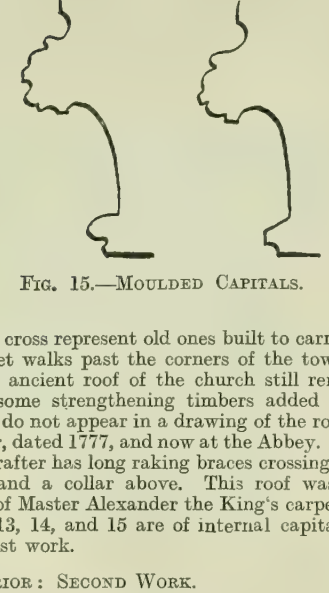

FIG. 15.—MOULDED CAPITALS.

of the cross represent old ones built to carry the parapet walks past the corners of the tower.

The ancient roof of the church still remains with some strengthening timbers added later. These do not appear in a drawing of the roof by Carter, dated 1777, and now at the Abbey. Each great rafter has long raking braces crossing in X form and a collar above. This roof was the work of Master Alexander the King's carpenter. Figs. 13, 14, and 15 are of internal capitals of the first work.

EXTERIOR: SECOND WORK.

About 1905 a considerable work of re-casing and re-editing "Wren's" restorations of the clerestory on the west of the north transept and of the choir adjoining was begun. On my first official visit I noted, December 12, 1906: "The clerestory of west side of transept is practically completed. First bay of north side of choir is stripped for recasing." (It was arranged that after the choir bays we should repair in detail continuing what existed without any attempt at making the details more sham correct.) "In this first bay traces of the blank arch to the right of the window has been found (the left was doubtless part of the first work, compare *Gleanings*), the face of the recess, weathered as it is, shows how very finely jointed the original masonry was. Mortar ⅛ in. at most. (This blank arch was 2 ft. wide and no less than 9 ft. high and formed of an order 9 in. wide.) Original thirteenth-century squinch work at angles by lantern exposed." These were remnants of squinch arches which allowed the parapet walk to pass the angles of the lantern tower. "Original cornice was in two courses like 'Wren's.'" That is, it had a deep main course and a narrow dripping course over: only the backs of the stones remained. Some fragments which exist show a course about 12 in. deep with a big hollow having projections (carved ?) at intervals (Fig. 8, G).

In the second work there were many variations from the first, the blank arches just described

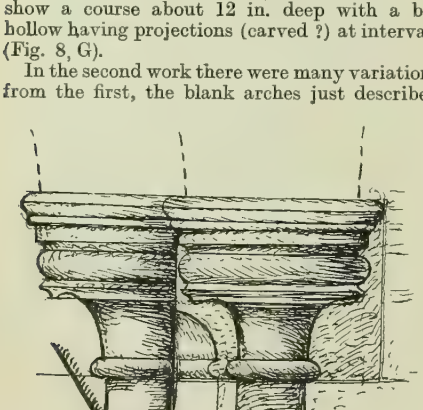

FIG. 16.—CAPS BETWEEN WINDOW AND BLIND ARCH.

were clearly not contemplated by the first master, for on the south side as on the north, the *eastern* jamb of the first window which belongs to the first work is plain. Such blank arches show a return to English fashions.

On the south side they exist with the aisle windows as well as in the clerestory; they do not occur on the north aisle because the buttresses are here of full width and there was no room for such flanking arches. These blank arches flanking the windows are very similar to examples at Fountains, Beverley and Lincoln. The last-named was doubtless copied with much else from Westminster itself, but the two others are earlier. As to the date of these, I consulted my friend, Mr. J. Bilson, who tells me: "There is no precise date known for the thirteenth-century choir and transept at Beverley—second quarter of century or *c.* 1225 to 1245. The new work had been dedicated before 1261. Beverley shows influence from Fountains." All this seems significant for the second work at Westminster was largely done under the mastership of Robert de Beverley, who fully succeeded John of Gloucester on his death in 1260–1. Robert was already working under the older master in 1259, and I have little doubt that he was already in charge at the Abbey when the aisle windows were reached.

In the work of repair a few months later one of the compound capitals, once under a window arch and on which a blank arch also fell, was found buried in the wall above the third clerestory window. This is of Purbeck marble *moulded*, and shows the type of detail of the second work (Fig. 16). The flying buttresses here had no marble shafts against the wall.

The triangular triforium windows of this part have three foiled circles instead of a single larger one. Essex, writing about 1780 (?), said: "The triangular windows at Westminster are of two sorts; all that are of this form (sketch with three circles) are the original, but the others having been renewed of late years are not of true form." (MS. Notes at B.M.) Essex was mistaken as to the entire alteration of the renewed windows to the eastern part, but the others when he wrote were still *original*. There is a drawing of one of them by Carter now at the Abbey, and they seem to have lasted on till 1835, when they and the aisle windows beneath were "restored" by Blore. The inner halves of some of these windows, except for the foiling, still remain.

The niches of the pinnacles of the buttresses appear in Wren's model of the church, and a sketch of them by Carter also exists; they must represent the original work with fair accuracy. The Cloister bays of this part are most elegant and share in the characteristics of the second work.

INTERIOR.—The setting out of the complicated plan is so exceptionally accurate that it is evident that the first work was begun as a whole on a cleared site. At the same time there are small variations of detail which show that the building was begun at the apsidal end. The bases of the apse pillars and those of the ambulatory are more delicate than elsewhere, some of them have hollows in their profiles and carved leafage filling the angles between the circular and octagonal forms. Apparently the work was pushed forward so rapidly that much had to give way before the King's haste. The arches first turned must have been those which have wood ties or rather props—the iron tie-bars were not ready in time. The diapering of spandrels of the main arches is smaller in greater part of the presbytery than at its north-west corner, and this earlier diaper is found on the east side of the south transept also.

In the second work the details of piers, wall-arcade, triforium, clerestory, and vault were modified, but so sympathetically that all is perfectly harmonious. The most marked variation is in the additional ribs of the high vault. A part of the changes had been intended from the first. Thus the first pillar west of the crossing although it is of the early work is different in plan from those to the east, but it has, like them, marble annulets, while those further west have them of bronze—an fashion (Fig. 5). The vaulting shaft o first pillar starts above a capital, while be runs up from the floor without an inte capital. The first bay of triforium also of the early pattern. In the secon all the windows and the cloister openin five foiled roses.

This second work does not show the s haste which are so apparent in the first The details, such as the cloister trace the wall-arcade of the aisle with its spandrels, are exquisite. Among the is that of Simon de Montfort, and as thwaite observed, this would hardly ha chosen after 1264.

PLANNING.

The plan was closely conditioned by t existing buildings and cloister. To the e the Lady Chapel, old or rebuilt: connecti this may have been formed by a vestibu or the chapel may have opened direct the ambulatory as at Amiens. A por the actual work against the ambulato exists (Fig. 6). This is a plan taken level of the wall-passage of the chap formerly thought that this wall passa minated with the existing polygonal cha the north-east and the south-east, October 5, 1909, I got into a continuatio ward of the passage from the south-east from A to B on the plan (Fig. 6). Beyo point B the passage is blocked by th of Henry VII's Chapel; what remains, ho is sufficient to show that there was a squa here rather than a polygonal chapel. triforium stage it is evident that this spa floored at the level of the triforium extends over the other chapels around th There must either have been a transver (Fig. 6, F) terminating this space to th or an upper story at triforium level ex over the whole chapel. Perhaps the fo more probable. The surface of the wall p still had its old whitening and rose deco and the marble shafts and bases still re some polish. An outer base of the eastwa tinuation is on the level of the window and it falls on a sill similar to the windo There was certainly here a blank like a w light similar to those in other chapels doubtless it had a companion light to th of it where not blocked by the buttress a "blank" and the light would have mad normal two-light composition. There w an inner and lower base on the passage ran east exactly similar to those under the of the rere-arches of the windows. F indications of moulded arches were foun under the leads which form the roof existing low vestibule between the churc Henry VII's Chapel. This part was similar to the polygonal chapels, except was square. The two radiating buttresse to this bay with their fliers above stil (renewed).

The doorway in the south transept e from the east was the immediate way of from the Palace, and it must have be King's private entry. It might be call Palace door. Close against this door transept is another which opens to a spir which ascends to a wall passage acro transept end, leading to a beautiful ch which forms a gallery story intermediate b the ground floor and the triforium and occ the space over three bays of the cloister. chamber now known as the Muniment R open towards the church on two side looking the altar and the choir, and I that it was originally the royal pew. position agrees with the tradition in pala castles of having gallery-pews in their c This fine chamber, moreover, has s beautiful sculptured bosses in the vault. are also several carved royal heads am elaborate decorations and also traces of p on the window jambs. One of the capit hawks perched on the foliage (Fig. 14).

There was a second way of access fr cloister, and the series of radiating

Vicarage, Down-street, London, W.1;
ld-Marshal Lord Plumer, through Lieut.-
Poole, 36, Eaton-place, London, S.W.1.

A GERMAN INNOVATOR

ONE feels that much of the work of the ultra-modern school must be judged not so much from actual performance as from the promise which it may hold out. Otherwise judgment on such work may be unduly harsh, and ideas stifled in their genesis, merely because their preliminary manifestations are tentative and crude.

The buildings and designs of Erich Mendelsohn* cannot be seriously regarded as fully developed expressions of the steel and concrete industrial architecture, the dynamic idea translated into form. They appear too crude for comparison with the finished product of any classic, romantic, or crafts school of design. They will command interest and respect only if they stand the acid test of fitness for the practical problems which they arise to serve, and of this fitness plans and photographs do not permit a considered judgment. As essays in pure form, as straightforward expressions of material and structural design, they appear to be a failure at the best: sincere but tentative effort; at the worst, tortured and bizarre attempts at architectural notoriety.

One may dismiss this latter hypothesis on the basis of our information regarding Mendelsohn: his dreams during the war of a better and finer foundation for a living architecture, his hopes, born in the trenches, of a genuine expression for the industrial post-war era. He was so sensitive as to visualise the post-war problem and evidently prepared to meet it by an architectural formula compounded of the artist and the engineer.

As an introduction to his book we find reflections and lectures obscure as are the most involved of German philosophic writings. Here, again, we cannot judge. Either Mendelsohn is often writing untranslatable nonsense, or else he has been cruelly ill served by his translator; for many of his sentences, words and arguments, are not only un-English, but incomprehensible.

The chief value of this publication of Mendelsohn's designs lies in the stimulus which they supply to others to attempt fresh and logical architectural expressions; in the sometimes successful massing of his buildings (*vide* the "New Hat Factory"), and in the plastic handling of form in concrete construction as exemplified in the Einstein Tower. In addition, there is interest in the actual technique of the sketches and working drawings. Judged from the standard of production, the book is in every way admirable; but should there be a further edition we hope that the obscurity of the present text will be remedied.

MYTHS OF CHINA AND JAPAN†

IT is a fairly safe thing to say that, apart from the mere trade stuff turned out for the European markets, the Chinese potter never made and decorated a pot that had not an inner meaning—perhaps twenty meanings. A prunus jar is something more than "just a piece of blue and white"—a rather unconvincing sketch of plum blossom reserved in white on a blue ground of cross hatchings. Whatever else in addition it may mean, it certainly is an epitome of spring and the ever-recurring miracle of the rebirth of Nature. It is told in two words—the first flower of the spring, and the breaking up of winter's ice. The plum tree, we are told, is closely connected with the dragon, inasmuch as a dragon was once punished by having its ears cut off and where the blood dropped to the ground the plum tree sprang to life. The dragon is a gentle beast in China, and never went in fear of our St. George. He is the water-giver—no dragon, and there would be no spring rain after the winter drought. He was not always a dragon, but a strange mixture of several animals. He himself, as the water-giver, is the prince of all the lucky things in the Chinese imagination, and associated with him is the priceless pearl—which is, perhaps, the moon—and so chasing or clasping the pearl is he depicted by the Chinese artist when he puts his hand to paper or porcelain.

We have merely hinted at one or two of the many things which the reader will find in the closely-packed four hundred pages of Mr. Mackenzie's book, and we can only commend in passing the thirty-four plates illustrating and illuminating the text. The aim of the writer is not merely to interest us in the myths of China and Japan as myths, but to help us to understand something of two great nations and ancient civilisations through a knowledge of their religious beliefs and ancient folk lore. Judging by the footnotes referring to authorities on almost every page, we can well believe that the author has left no stone unturned in tracing the origin of the myths. He shows us quite clearly how China received her civilisation from the Byzantine Empire—to state the case quite baldly and inadequately—and how the same influences that penetrated to the Far East drifted as far west as the Scottish Hebrides and, to quote from his preface, "When, however, it is found that China obtained certain myths and practices from the area called by its writers 'Fu-lin' (the Byzantine Empire), and that not only Byzantine but Ægean influences are traceable in the Celtic field, the charm-link between Gaelic Scotland and China may not, after all, be regarded as 'far-fetched.'"

The book should prove a useful and welcome adjunct to the many volumes on Oriental art now pouring from the press. The mere lover of legend and folk lore will be gripped from start to finish, and the art student or collector of pottery, prints and rugs will find it of inestimable value. He will learn something of the inner meaning of the innumerable "precious things," animate and inanimate, which go to make up the sum total of Oriental aspirations—long life and good luck.

WAGES ON PUBLIC WORKS

THE Public Works Conciliation Board has made an award, dated September 30, 1924, for the London Area, namely, the City and County of London and the whole of the districts of all the local authorities the whole or any part of whose district lies within the Metropolitan Police district. The award fixes the rates of wages to be effective for the three months, October, November and December, 1924, as follows:—Blacksmith, X plus 4½d., 1s. 8d.; concrete leveller, X, 1s. 3½d.; duct or earthenware drain layer, X plus 1d., 1s. 4½d.; fitter, X plus 4½d., 1s. 8d.; granite mason kerb, &c., X plus 5½d., 1s. 9d.; granite sett dresser, X plus 4½d., 1s. 8d.; jointer, X plus 1d., 1s. 4½d.; kerb fixer, X plus 4½d., 1s. 8d.; pavior, X plus 4½d., 1s. 8d.; petrol locomotive, petrol roller, or petrol air compressor plant driver, X plus 2d., 1s. 5½d.; pipe jointer (iron up to 6 in.), earthenware or concrete pipes and conduits, X plus 1d., 1s. 4½d.; pipe-jointer (iron) above 6 in. diameter, X plus 2d., 1s. 5½d.; platelayer, X plus 1d. to 2d., 1s. 4½d. to 1s. 5½d.; platelayer labourer, X, 1s. 3½d.; pneumatic pick operator, X plus 1d., 1s. 4½d.; rammerman, X plus 1d., 1s. 4½d.; scaffolder, X plus 3d., 1s. 6½d.; screeder, X plus 1d., 1s. 4½d.; steam roller driver, X plus 4d., 1s. 7½d.; street mason and flag dresser, X plus 4½d., 1s. 8d.; tarpot man, X, 1s. 3½d.; timberman, X plus 1d., 1s. 4½d.; wood block layer, X plus 1d., 1s. 4½d.; men working in "Boots," 1d. per hour extra; watchman, 7s. 6d. per shift minimum day or night. The hours of labour and overtime rates to remain as agreed on March 11th, 1920. "X"=labourers rate, 1/3½d.

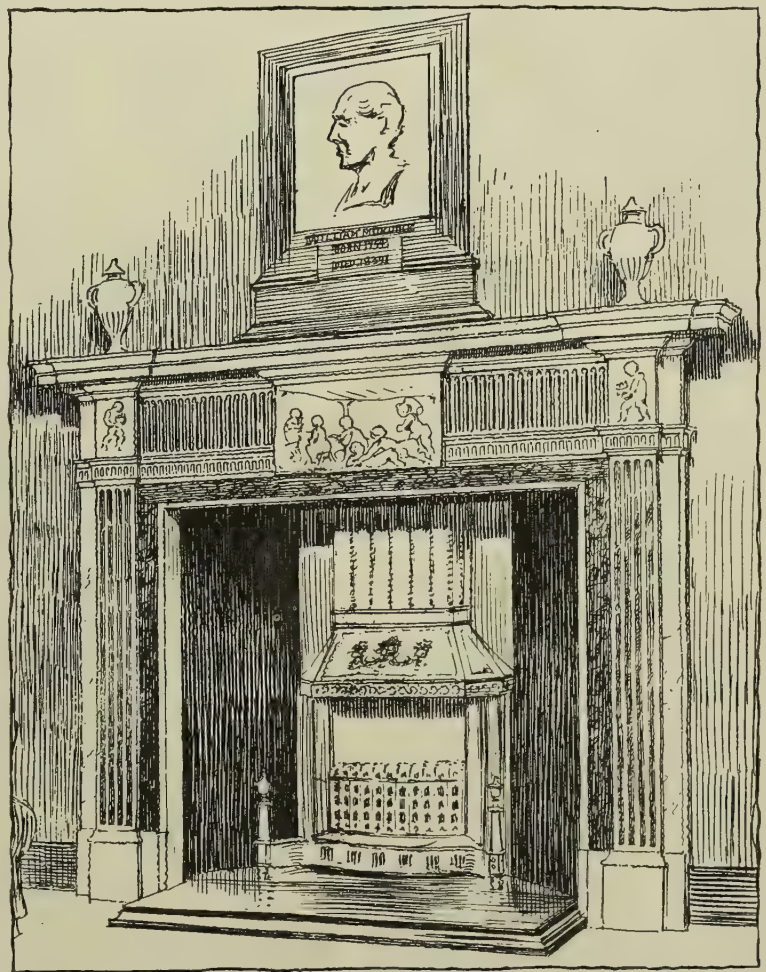
HEATING AND VENTILATION

FRESH AIR AND WARMTH

privileges that have followed upon ation have been truly bought at a price, n some respects we have undoubtedly e very inferior creatures in the process. same power that gave us the ingenuity to houses and design clothes, has certainly ed us of a great deal of that natural resist- o the elements which the remainder of the l kingdom possesses. Whether the heating er and the tailor came to the aid of the rown bald, or whether their premature precipitated the affliction, are conjectures le important as the vexed question of the y of the egg and the chicken. What con- us to-day is rather that there exist certain s in the human constitution that must be the best and most scientific ways if we are r an efficient part in the civilised world of .



ificial heating is perhaps one of the most tant of these means of living and very allied to it is the question of ventilation— , the one is almost the natural corollary of her. The ancient fire on a hearth in the of the hall floor, and its stifling effect, uced the first germ of ventilation, though k but the form of a hole in the roof. It ut a small step to the introduction of the flue, and yet this advance has sufficed for rpose through many centuries, and even more than holds its own in the class of tic work that concerns the vast majority. smoke flue does indeed serve a more purpose than that for which it was ally designed, for the strong upward t promoted by the rarefied heated air and , makes a fairly efficient exhaust whereby nant atmosphere is avoided and frequent al ensured. The real objection to reliance the smoke flue for ventilation lies in the hat what efficiency it has is largely acci- l, and as such it naturally does not perform unction in its most direct and efficient r. It operates from a point where the at its purest, and rapidly extracts it before borne its fair share in the relief of the over- ned atmosphere of the room. The fire s also a most imperfect source of heat. Of ree methods of transmission of heat—con- n, conduction, and radiation—little more he latter is called into play, while a vast f heat is sucked rapaciously up the chimney te itself in the open. It does indeed seem rdinary that we should tolerate such a f affairs, and yet as we write and read the , we know full well that we love the coal ith all its faults. It does indeed stand as bol of comfort to which the heart at once ds, and we shall most probably have to with it for long to come. Such advances now make are more in the direction of menting the function of the fire and ting many of its faults.

need not dwell upon the more ambitious aborate systems by which our large halls heatres and underground stations are ained with a comfortable temperature and thy atmosphere, and there is much to be of in many of the achievements of the age direction. For most of us, the treatment domestic house is of greater and closer n.

tral heating implies a first cost which our lt times may sometimes distort into an ance of the impossible, but we should do resist the impulse to be appalled and re the incessant outpourings of waste in the household with their sum capital to get a true perspective of the real n between the two. Consider the dupli- res that have to be cleaned out, stoked, d with a full scuttle from some remote the range kept alight during all hours of a non-cooking day; perhaps the sick room fire upstairs. Think of the frenzied airing of bedding in the damp spare room on the arrival of the unexpected guest; the continual repolishing of furniture that would keep a surface in a reasonably dry atmosphere. And, do not let us forget the lost days in bed recovering from the cold caught on the chilly staircase after the stuffy room. Surely even these chance shots would seem to indicate that we are seriously reducing our income when we struggle to save this moderate sum, that fades into a fraction when spread over the number of years that would be served. Then there is the great opportunity that such a system affords towards an improved system of ventilation. Take the case of the ventilated radiator. The air drawn in and warmed on its way, passes naturally up into the vitiated upper strata. There is little or no loss of energy and the inlet of fresh air is not left to the inefficient joiner to supply by way of ill-fitting doors and windows.

How far the design of some of the radiators with which we are familiar has adversely influenced the wider use of central heating with all its advantages, is difficult to say. The test of beauty is, however, far more incisive than we are apt to imagine, and may often give the definite lead towards the solution of many a knotty problem by way of the sensibilities, after the unaided intellect has given up the task in despair. It is in such instances as this that the architect with his broader outlook may with advantage influence the specialist. With a perfectly legitimate function to perform, it must be as fit for a beautiful expression as is the fireplace. We must, therefore, welcome with enthusiasm the beautiful models which have been designed comparatively recently. Their graceful and slender lines can give an added beauty to the finest room, as a piece of well-designed furniture, and the expensive grilles and casings wherewith we were wont to cover the abomination, with disastrous results to the circulation, can now be dispensed with. This must be reflected in an impetus towards the more general use of central heating in this country.

Time will show if this is to be so, or whether the traditions of an old country are ever to stand in the path of progress. Let no prophet risk his reputation upon the fate of the open fire, which appears to be a part and parcel of our home life. It is no doubt very stubborn and stupid of us, but we shall be forgiven if the same trait appears in other directions in the form of that spirit of firm determination that has carried the country through so many dark places. It is well to exercise the quality in maintaining an interest in many of the duller sides of building study, which can always absorb the attention of the mind that recognises that the inspiring whole of building achievement is only to be built up of practical component parts none of which can be neglected if the whole is to be completed and realised.

CHEAP HEATING: WARMTH WITHOUT WASTE

BY MANNING ROBERTSON, A.R.I.B.A.

WE are often told that heating by hot air is unhealthy, that the radiant heat of the open fire is "Nature's way," and that the heat derived from radiators or hot stoves leads to stuffiness, sore throats, and ill health. But those who admire Nature's way overlook the methods adopted by Nature to prevent our winter climate from being as cold as that of central Canada or Siberia. We all know how much we (sometimes) owe to the radiant heat from the sun in summer, but why is not the winter, when the sun is virtually absent, not far colder than it is? Other countries on the same latitude suffer from a mean January temperature 70 degrees and more below ours. The answer is that Nature has blessed us with the Gulf Stream, with a storage for heat in the form of surrounding seas, and with a prevailing wind warmed by the water. In other words, Nature relies on the hot-air principle, known as convection, even more than on the direct radiant heat of the sun. There is nothing, therefore, in the stock argument about "Nature's way." It is necessary here to mention that radiators ought to be called "convectors," since their function is to warm the air by convection rather than to heat objects by direct radiation like the sun or the open fire.

How has the prejudice against warm air arisen? It is safe to say that it is due to the lack of ventilation usually associated with steam, hot water, or hot air heating, and, in addition to this fatal stagnation, the rooms are nearly always over-heated. Stagnation of the air reduces its cooling power and a feeling of oppression results which is relieved when the air is set in motion, hence the use of fans in the theatre. Within reasonable limits vitiated air in motion is preferable to motionless pure air. When sitting in front of an open fire one is ready to tolerate more draught than when sitting in a room heated by a radiator, and this is the main reason why the open fire is regarded at the healthiest form of heating.

The open fire is terribly inefficient, and a dweller in a cold country would never think of relying upon it. His objections are, (*a*) that it warms one side of him by radiation while the cold air freezes the rest of him; (*b*) that only about 25 per cent. of the available heat from the fuel is utilised. In other words, for every £1 spent on fuel for the open fire 5s. worth of heat is obtained and 15s. is wasted. This is not a good bargain.

Where, then, does this enormous quantity of heat go, and why do we not use it? Normally it goes up the flue and heats the solid brickwork of the chimney before it escapes, still hot, into the open air to warm the countryside. This applies in varying degrees to the heat from stoves, ranges, open fires, and even to gas fires. Experience shows that if a stove is placed 20 ft. away from an ordinary fireplace and connected to the flue with 5-in. sheet-iron piping, laid nearly horizontally, the heat obtained from the 20-ft. length of piping is greater than that obtained from the stove itself, and, more astonishing still, the heat of the pipe where it enters the wall is not noticeably less than where it leaves the stove. A further 20 ft. of vertical piping would, therefore, provide almost as much heat as the original length. The heating surface of an ordinary coke stove may be taken as about 7 sq. ft., while the 20 ft. leng 5-in. piping presents 26 sq. ft., up whi the hot gases have to pass. It is not, fore, astonishing that the heating pow this pipe exceeds that of the stove a equal to a very large series of hot radiators without entailing any of the The heating value of such a pipe is g when it is dull black than when it pr a bright surface.

But, it will be argued, admitting th ciency of the flue, there are obvious diffi when it comes to using it. It is unsi and the heat is concentrated and can carried to convenient points as can hot It is in heating the basement passag large houses that such horizontal flue be of the greatest service, for if a bas can be kept warm and dry the house will be free from the chill that has its in cold and damp basements; draught be warm instead of cold, and the floors rooms above will be warm—an imp point as the Romans well knew when went to so much trouble to heat their by means of flues. The basement may times be used as a further source of he placing the stove there in a small hot ber with a grating over it in the c leading to the main centre—generall staircase hall—of the house. The co supply must be admitted into the hot ch through large openings near the floor, a should be noted that even this air, befo stove has warmed it, is not unduly co cause it has been heated by the flue-pi which reference has already been made which lies mostly outside the hot cha The writer has experimented with this m and has found that the uprush of hot ai the body of the house is remarkable a the greatest value in keeping the house Where the basement is a small one ar in use the grating may not be desirab cause sound, and often the smell of co would be communicated to the floor abo

In small houses that have no baseme periments should be made in the utilisat flue heat, whether from the kitchen when the hot gases could be allowed al tive routes for summer and winter, or, still, from a stove in the main hall,

mber should be large enough to
to climb up in comfort for in-
renewal of pipes; an access door
laced at the bottom and hand-
grips built into the wall to facilitate examination. The hot chamber, being built of 4½-in. brick or 4-in. concrete blocks, would be safe from fire, being itself constructed like a flue, and the pipe would be clamped at intervals in the corner, delivering into an ordinary brick flue where the hot chamber ends. The hot-air inlets to the bedrooms are placed high up to tap as much flue heat as possible, and to avoid excessive communication of sound. Experience shows that a radiator or other source of heat near the ceiling is not appreciably less efficient than the same supply of heat placed low down, for the hot air in the latter case tends at once to rise to the ceiling.

The diagram, for convenience, only shows two bedrooms on the first floor, but the hot chamber could be carried up to warm rooms on the second and third floors provided that the cool air inlet was proportional to the size of the outlets. The hot chamber is here shown connected up with an ordinary chimney stack containing a common flue and a gas flue, but the chamber could contain more than one flue.

In a house fitted with the system shown in the diagram the entrance hall would require a full allowance of fresh air from outside, or the hot chamber could receive its air supply direct from the open. Warm air circulating through the rooms would permit of open windows, and air stagnation could be avoided. The attraction and associations of the open fire are deeply rooted, and such a fire contributes definitely to the appearance of comfort and warmth; if we could obtain a cheap and efficient smokeless fuel and utilise the flue heat, the objections to the open fire would be removed. The principle of the hot-air chamber would be equally applicable to the open fire, and by its aid we could save a large proportion of the 75 per cent. heat value which we normally send to waste. Even the most up-to-date and approved methods of central heating as a rule make no provision concerning the flue.

Heating is in its infancy, especially in England. Sooner or later we shall be forced to break away from the 25 per cent. efficient open fire and brick flue. These tentative notes are written in the hope that those interested will carry out experiments and publish any satisfactory results they may obtain.

FIRST FLOOR GROUND FLOOR

THE ALL-ELECTRIC HOUSE

BY AN ELECTRICAL EXPERT.

few years much progress has been commercial application of electri- purposes than lighting. Elec- ting, cooking, and for the opera- r-saving appliances in the home idly ceasing to be a novelty. The development is to be found in the s of electricity supply under- from all parts of the country un- id increase in the domestic load t is of importance that the nature pment should not be misunder- not a transitory phase, but the e definite policy now generally of encouraging domestic electri- reasons and circumstances dic- licy need not concern us here. it exists and is being steadily s simple fact is of very consider- ce to the architect and builder. gh the flexible nature of elec- fact that it can be applied with eating, ventilating, cooking, and may have been appreciated, it lly been considered feasible to these services in a single build- ing owing to the practical objection of excessive cost. Even in the comparatively few areas where cheap rates for electricity have obtained for many years the large outlay involved in respect of initial cost of the equipment has been a deterrent to complete electrification. To-day these barriers have been largely removed.

The two most important manifestations of the desire of the electricity supply industry to encourage the domestic load have been (*a*) the adoption of special tariffs, or scales of charges, whereby electricity has been made available for heating and cooking on a competitive cost basis with alternative agents, and (*b*) the introduction of hire and hire-purchase facilities for equipment of every type. The results have been so far successful that it may be justly claimed that the novelty stage is passed, and though we are still in the early days of the domestic electrification era the All-Electric house is a fully practical proposition in many electricity supply areas to-day. So far we have confined ourselves to generalities. They are necessary in order that a broad idea of the situation may be presented. We may now, however, turn to a concrete example to demonstrate that the All-Electric house can be operated not only economically but actually more cleaply than a similar dwelling on more conventional lines.

In connection with its housing scheme at Riddrie the Glasgow Corporation decided to test out practically the All-Electric house idea. Two of the standard type houses being erected were equipped throughout for electrical service. The only difference between them was that in one house a single coal fire was retained for heating the main living room, and in conjunction with this a boiler was fitted to furnish a bulk hot-water supply; the other house was completely "All-Electric." These houses, which were put into service in February, 1922, consist of a living-room, drawing-room, three bedrooms, bath and kitchenette. The cost of erection was slightly more than £1,130, and the complete electrical installation amounted to a further £80 16s. 6d., making a total of approximately £1,211. The figure of £1,130 was really the builder's estimate, the actual cost being increased slightly owing to unforeseen fluctuations in the cost of labour and materials

during construction. It is the better figure to employ, however, when arriving at the percentage cost of the electrical equipment compared with the total cost; this works out roughly at 6½ per cent.

As the result of forty-eight weeks' occupation under normal conditions of use, etc., the running expenses of the above two houses worked out as follows:—

In the All-Electric house the electrical energy consumption was 5,350 units for the total period, or 103 units per week. At the tariff in force, viz., a fixed charge of 2s. per week plus ½d. per unit used—the cost works out at £5 4s. 0d. fixed charge, £11 2s. 11d. energy charge, making a total of £16 6s. 11d. The average outlay then for lighting, heating, cooking, water heating, clothes washing, ironing, and use of all other electrical appliances was 6s. 4d. per week.

In the electric house with one coal fire the corresponding figures were: £5 4s. fixed charge, 4,166 units at ½d., £8 13s. 7d. energy charge, or a total of £13 17s. 7d. To this must be added the sum of £4 11s. for the coal used during twenty-six weeks, from the end of October to the beginning of May, which brings the total cost up to £18 8s. 7d., the average all-in figure being 7s. 1d. per week.

The above figures supply concrete testimony to the fact that electrical service is not the fabulously expensive myth of popular fancy. The actual tariff charge is, of course, an important matter. In the case quoted it is the standard rate for public supply in the Glasgow area, and this is in some respects typical of the special competitive tariffs now being introduced to encourage a greater use of electricity for all domestic purposes. It is quite a simple matter to ascertain with the aid of the consumption figures given what the cost would be for any rate.

It is of interest that the Riddrie estate also furnishes comparative figures for the running expenses of the type of house in question when gas and not electrical service was employed. Without going into details it will not be out of place to present the respective figures in summary form, together with other data germane to the matter. They are as follows:—

1. Riddrie "All-Electric"	£16	6	11
2. Riddrie "Part-Electric"	18	8	7
3. Riddrie "All-Gas": 26 weeks (winter) at 10/6 recorded, plus 26 weeks (summer) at 5/3, estimated	20	9	6
4. Riddrie "Part-Gas," say ditto	14	0	0
5. Kirkhill "All-Gas"	29	8	3
6. Maryhill, electricity for lighting, gas for cooking, and coal for heating	18	1	10½

From the above figures, which are the records of practical experience, it is plain that electricity for domestic service is quite competitive with alternative methods even on the basis of running cost.

The All-Electric houses dealt with, it may be noted, were simply standard dwellings equipped for electrical service, the cost of the installation and apparatus being in the nature of an extra to the actual outlay on the building. Had they been designed primarily with a view to electrical operation the design could have been materially modified and an appreciable saving effected in the building cost by the elimination of grates, chimney breasts, and flues which, with electric heating, are superfluous. In connection with a number of All-Electric houses that have been erected in various parts of the country where this has been done, it has been found that the saving in constructional outlay more than compensates for the cost of the whole of the electrical equipment. Due to this the All-Electric house is actually no more expensive to build and equip than its counterpart on more conventional lines; it may be appreciably cheaper. In addition to saving money the elimination of chimney breasts increases the available space in a room and allows much greater scope in respect of the interior arrangements.

Though actually the fully All-Elec proved slightly the more economic case of the Riddrie houses, this i form generally advocated. Conser domestic matters is extraordinarily s the last thing the British housewif sacrifice to the demands of scientific ment is the coal fire. Without it th thing to poke, while the strong psy effect of an open grate fire cannot As a concession to these two fac usually considered desirable that on should be retained even in an othe Electric house. Where this is don a good case also for retention of pressure saddle-back boiler for bulk hot-water supply, and the combi these two is, as a rule, to be reco The single coal fire with high-press is best installed in the main living provision should be made for electric supply during the summer months auxiliary supply in the winter.

Hitherto most of the activity in the erection of All-Electric houses municipal. The private builder and tect, except in one or two isolated ca not tackled the problem on a comp scale. But the time is at hand whe be anticipated that they will find it to do so. Electric lighting has long cognised as a commercial asset to Electric cooking and heating are re much greater ones. The former a preparation of food to be carried on minimum of trouble and with abs tainty of uniformly good results, latter enjoys all the advantages of co associated with electric light applied It is not, however, the intention an eulogy of electricity or to dec methods which are of proved value. cause electricity widens the scope for tect in the application of his art t that electrical service is the best and mical one at least deserves investiga

THE GAS HEATING EXHIBIT AT WEMBLEY

ARCHITECTS and builders are constantly confronted with problems regarding lighting, cooking, heating, water heating and other domestic services for cottages, residences and other buildings with which they are dealing. At the Gas Exhibit at Wembley modern methods of treatment of all these matters are very clearly and practically demonstrated, regarding which details of a general character have already appeared in *The Builder*. In our special Heating and Ventilating Number, however, we feel that it will be of interest if we set out some further particulars regarding that portion of the exhibit which specially demonstrates what gas can do—and is doing—in the direction of heating, and also particulars of an interesting system of ventilation.

For a number of years past architects, heating engineers and builders have been informed by those connected with the gas industry that great improvements have been effected in gas fires, and in the general science of gas heating. They have also seen many illustrations of gas fires of modern type, and have naturally had actual experience of a number fitted in residences and other buildings with which they have been dealing, or have come in contact. At the Wembley Gas Exhibit, however, it has for the first time become possible fully to realise the advance which has been made in the direction of the provisions of a comprehensive range of gas fires of plain and "period" designs, in a number of attractive finishes.

The Gas Fires in the Main Hall and Lounge.

Apart from some heating exhibits of a special character which are referred to later, all the gas fires are shown in the main hall and lounge and the ante-room. In this part of the exhibit there are no less than 23 "named" designs of gas fires of various sizes, in which are included examples of the following periods or schools:—Georgian, Adam, Early Victorian, Italian, Tudor, Jacobean and Modern. These designs are carried out in one or other of the following finishes:—Plain black, oxy-silver, satin-brass, oxy-copper, antique gold, copper - bronze, stippled grey, armour bright, copper, and dull silver. An important feature of the exhibit is the very carefully chosen setting of rooms and fireplaces, in and against which the fires are fitted, and by an inspection of which it can be realised that one can now obtain a gas fire to harmonise with any surroundings likely to be met with in residences or buildings, either ancient or modern in character.

The Model Rooms.

The series of model rooms—some of which are descriptive of the "Seven Ages of Woman," to which reference has been made from time to time in the public Press—contains some fine examples of gas fires, those installed in the children's playroom and the student's bed-sitting room each being equipped with a very useful gas ring of neat design and appearance. A selection from some pen-and-ink drawings by Mr. T. R. Davison will convey a far better impression of these model rooms, and the gas fires fitted therein, than could possibly be conveyed by any descriptive matter. Figs. 1 and 2 are drawings of two of the rooms in the "Seven Ages of Woman" series, Fig. 1 being the student's bed-sitting room, in which may be noted the "Winchester" gas fire in oxy-copper finish, with a boiling burner attachment, and a small cupboard at the side of the fireplace in which the small "coin in the slot" meter is fixed. Fig. 2 is the "matron's" bedroom, with an "Adam" gas fire of satin-brass finish. Figs. 3 and 4 are illustrations of a pair of really fine rooms wi priate gas fires, which undoubtedly enh general effect of the decorative scheme rooms are not included in the "Seven Woman" Tableaux, Fig. 3 being repre of a doctor's consulting room with a "C gas fire of oxy-silver finish, and Fig. 4 a man's room with a "Westminster" g copper-bronze finish. The Ante-room, the Main Hall and Lounge and The Science and Industrial Hall, contains of the old dog grate type, known, resp as the "Lansdowne" and the "R These fires are fitted to a fine pair o fireplaces and mantelpieces of Adan Fig. 5 illustrates the "Raphael" fire, a dull silver finish. The remainin heating features to be seen in the Main the three pylons which are erected centre, placed at such distances apart a satisfactory balanced effect.

The Three Pylons.

These pylons are hexagonal in shape six gas fires which are fitted to eac against backings of marble and tilings designs and colourings, in order that t mind can decide the type of fire which best in any situation which is to be d With a view to catering for the kind of fireplace which is usually found in ho pied by those whose means are limited call for fires of absolutely plain design finish, one of the pylons contains a s this type of gas fire. They are quite in to purchase, and many are hired at l from a number of gas undertaking gives an impression of a general view o of the Main Hall and Lounge, some of rooms and two of the pylons. It is

gas more than 100 of their schools—

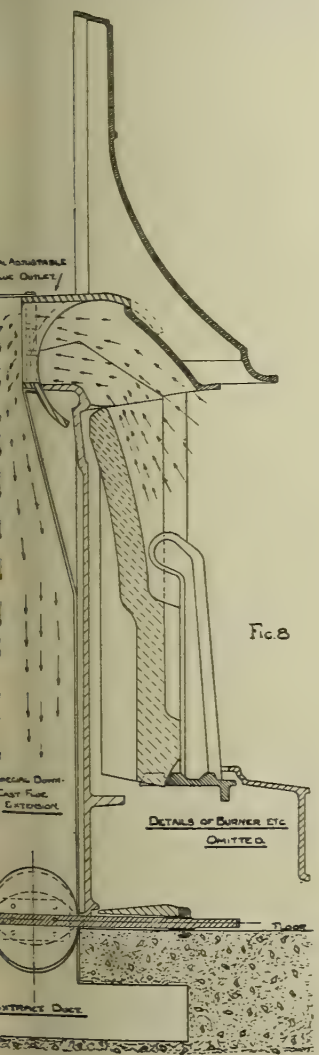

FIG. 8

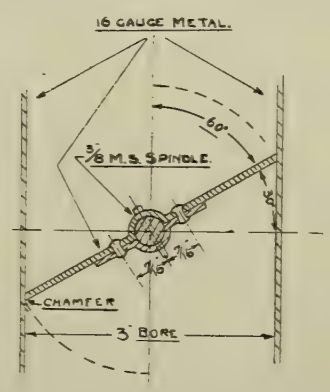
are fitted within the bowls. The lighting fittings and shades in the model rooms are also worth more than a passing glance; a feature of special interest to visitors being the ease with which the gas burners may be switched on and off.

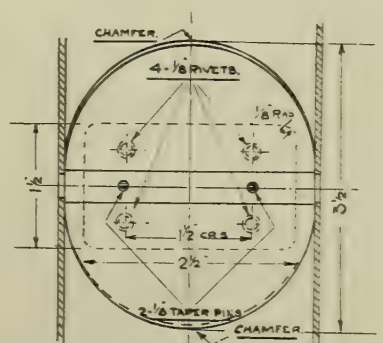
Methods of Fixing Gas Fires to Old-fashioned Grates.

An interesting exhibit to the architect or builder may be seen in what is known as the Domestic Science and Industrial Hall, where a number of examples of old-fashioned hob and register coal grates are shown, with suggested methods of treating them with asbestone or sheet iron backings, against which gas fires are fitted. Such grates have always presented difficulties to those who have wished to instal gas fires, but it is here clearly demonstrated that with proper treatment very pleasing results are obtainable. Two instructive methods of installing the rapidly increasing "built-in" gas fire complete with mantle, are also shown here, one of which has the "Economy Flue" constructed in concrete blocks, and the other in brickwork, in the thickness of the wall.



The foregoing is a short account of the principal features of the exhibit as far as gas fires are concerned, and though much more might be written on the subject, it is necessary to pass to a matter which is of particular interest to ventilating engineers, and to those who desire to generate electricity on their own premises.

The Ventilating System.



When passing through any portion of the Gas Exhibit the casual visitor does not realise that the building is only a shell of walls erected within another building—the Palace of Industry—and that windows, ventilators, flues and chimneys of the kind which are ordinarily met with could not readily be introduced into the structure. Yet, if the exhibit was to be a real example of what the gas industry can accomplish, it is obvious that gas apparatus of all kinds, including those for lighting, cooking, water heating, heating and—last, but by no means least—those for industrial processes, must be shown burning, many of them at one and the same time, in a fairly confined space. It was also necessary to make suitable arrangements for dealing with the vitiated air arising from the breaths and bodies of crowds of visitors. It was evident, therefore, that a system of ventilation must be carefully thought out. That this was successfully accomplished must be admitted by anyone who has seen the gas lights, fires, water-heaters and cookers burning, and the industrial processes, such as sweet making, aluminium melting, pottery firing, and metal cutting simultaneously carried on.

The Gas-Engine Generating Set.

The necessary power for the system is provided by a gas engine which has run without a break during the "open" hours ever since the Exhibition started. The power unit consists of one of the National Gas Engine Company's "P.E." type gas engines fitted with a specially heavy wheel for electric driving, and giving a maximum load of 20 B.H.P. on town gas. This engine is coupled direct by means of a flexible coupling to a current generator, having an output of 12 k.w. at 220 volts. This is a compound wound machine, of the standard type manufactured by the Lancashire Dynamo and Motor Company, Ltd. The speed of the set is 275 revolutions per minute. The switch-board is a two-panelled board of enamelled slate, having floor and wall supports. The generator panel is fitted with a 6 in. dial, moving coil ammeter, and a 6 in. dial, moving coil voltmeter. It has a back-of-board shunt field regulator, double pole switch, and two single pole fuses. The second panel is a feeder panel, arranged for four feeders, each being controlled by a double pole switch and two single pole fuses. The complete installation makes a compact and efficient generating unit, specially suitable for cinemas, and various industries where a fairly large supply of electricity is required at a cheap rate. The hourly gas consumption of the engine is 10,000 B.Th.U. per B.H.P. at full load (say, 20 cubic ft.), and the consumption necessary to produce each k.w. hour at the full output of the generator is approximately 16,000 B.Th.U. (say, 32 cubic ft.), by which, with gas for power purposes at 6½d. per therm (some gas undertakings sell it at less than this) electricity may be generated at about 1d. per unit. The engine starts up easily, and runs satisfactorily under all conditions of load, and the set needs practically no attention. Fig. 7 is a photograph of the complete set, including a waste heat boiler, in which steam is raised by the exhaust gases from the engine.

FRONT SECTIONAL ELEVATION REGULATING VALVE. SHOWN CLOSED.

SIDE ELEVATION OF REGULATING VALVE. SHOWN OPEN. SPINDLE OMITTED.

FIG 9.

The Intake and Extract Fans and Ducts.

The ventilation is carried out by two separate systems, one of which supplies fresh air, whilst the other exhausts the vitiated air, in addition to the products of combustion from the gas apparatus and the vapours, &c., from the various manufacturing processes. The whole of the fresh air is supplied by one centrally-situated motor driven fan of specially light construction, the air being distributed by means of a system of sheet steel ducts run for the full length of the building under the two platforms between the main hall and the Industrial and Domestic Science Hall. This fresh air fan is driven by a 2' h.p. motor and is capable of providing 500,000 cu. ft. of air per hour.

The exhaust system consists of four direct coupled motor-driven extract fans, which are installed in four fan chambers, situated in suitable positions in the exhibit. These fan chambers are made air-tight and the various exhaust ducts are connected to them. In each case the extract fan creates a suction in the chamber, thus pulling products of combustion, vapours and vitiated air into the chamber; they are then picked up by the fan and discharged upwards through a vertical discharge duct which passes up through the main roof of the Palace of Industry. The general extract ventilation ducts are erected over the plaster ceiling of the exhibit, exhaust gratings being provided in the ceilings of the various rooms.

The removal ducts for the products of combustion from the gas fires are run underneath the various rooms and the pylons, the usual flue outlet at the back of each stove having a short downward flue carried into these ducts. A small butterfly damper or valve is provided to each fire, for adjusting the strength of the pull to the degree which is necessary for the satisfactory removal of the products of combustion from the burning gas, and to create an additional ventilating effect through the canopy of the fire. Fig. 8 illustrates the method by which the products of combustion from each gas fire, and the moving air, are conveyed downwards into the extract duct, and Fig. 9 contains details of the butterfly valve. The four exhaust fans are together capable of dealing with 80,000 cu. ft. of air per minute—nearly five million ft. per hour.

The products and vapours given off from the various manufacturing exhibits are co means of galvanised sheet steel hood which is situated over each piece of ap and these hoods are connected by branch pipes to an underground duct, in turn, connected to a separate powerful exhaust fan situated in one chambers. This fan is capable of 300,000 cubic ft. of air per hour.

The ventilating installation was ca by Messrs. J. Jeffreys & Co., Ltd., He Ventilating Engineers, Barrons-place, road, S.E., and is of considerable valu dication of a method of heating by ga other use of other gas apparatus, inclu tory appliances, in premises where n upwards flues, are possible or permis where some kind of pressure system w cast flues is considered necessary.

In conclusion, it is not too much t the Gas Exhibit as a whole is a strikin of the fact that utility and beauty ca bined without detriment to either, practical and utilitarian matters nee unaccompanied by artistic effects an of appearance.

GAS IN THE HOME

The following notes descriptive of the Gas Exhibit at the British Empire Exhibition are by Mr. H. Austen Hall, F.R.I.B.A., architect to the Exhibit.

The purpose of this exhibit is to present the different uses of gas for all purposes of light, heat and power, in all phases of modern life. With this object in view, the exhibit takes the form of two large halls containing model rooms in which gas lighting and heating are shown in conjunction with suitable decorations and furniture, such as would be met with in rooms for different purposes. Thus on one side there is the "Seven Ages of Woman," from nursery times to old age, in a series of rooms, by Messrs. Heal & Son. These rooms are remarkable for the freshness and variety of their treatment and the versatility that is displayed in the expression of life under different conditions. The colour schemes are studied to give variety to the general scheme, and show some entirely new settings for gas fires.

It is desirable to think in terms of gas rather than coal if a successful treatment of gas fires is to be evolved, and there are shown some excellent suggestions for the modern gas fire and its setting. The fires have been selected in the first instance, and the surrounds have been designed to harmonise with them, thus avoiding the haphazard look that sometimes occurs in a new building. A series of period rooms are provided opposite those of modern design, to which they form a contrast. These are the work of Messrs. Osborne & Co., of Grafton-street, who show the styles of decoration from Queen Anne to Early Victorian. The fireplaces are well chosen and illustrate the wide range of designs that the makers of gas fires have placed upon the market.

The inner hall is devoted to the application of gas to water heating, cooking, and many forms of industrial undertakings. The general design of the interior is on simple classical lines, with coved ceilings, the whole being painted in simple grey and gold tones, which set off th colours of the rooms around them. light is by means of three inverted bo upon pylons in the centre of the room, of flood lighting new to gas, and highly in this case. There would appear to be able possibilities in the use of standar of pendants in large rooms such as thes idea could be developed in banks and of a similar nature. The pylons als good places for the display of gas illuminated panels for advertising g purposes.

Externally, the feature is the entran which projects to correspond with work in the Palace of Industry. The de classical lines, and relies upon the la the scale rather than ornament to necessary dignity to the entrance. provided for the smoke abatement and the historical section, and also exhibits of the Sulphate of Ammonia F

MODERN INDUSTRIAL LIGHTING

The deplorably bad state of factory and workshop lighting at the present time becomes very apparent when one compares the existing general standard with that recommended by specialists in illumination. Depending on the nature of the industry and the particular department of the works, good illumination in engineering factories is indicated by a standard of 5 to 10 ft. candles on the working plane. Considering that Home Office Factory Regulations recommend a minimum illumination of from .25 to .4 candle-power (this is on the floor level, however), the average value must be appreciably less, and the vast discrepancy between good lighting and present-day practice is only too plain. There are a number of reasons for this, and much might be written concerning them. That, however, is not our intention. Rather it is desired briefly to indicate what constitutes correct illumination and its very concrete advantages to the factory or works owner. Merely by doing this, many of the more obvious faults common in existing installations will be exposed.

First we have to consider the source of light —the lamp filament. It is intensely brilliant —particularly so in the case of the modern high candle-power gas-filled lamp. Like the sun it is dazzling to look upon and must be shielded from the direct line of vision of the workers. Light is emitted in every direction, and only a relatively small proportion is delivered downwards on to the working plane in the case of a lamp freely suspended. A reflector is therefore necessary to deflect downwards the light which would otherwise be wasted in illuminating the ceiling and factory walls. If the maximum amount of light is to be concentrated on the working plane, the reflector must be designed to that end, and so must be scientifically proportioned to suit the particular type and size of lamp in conjunction with which it is to be used. We arrive, then, at the fundamental requirement of a good lighting unit—a lamp housed in a suitably designed reflector. To obviate glare the bottom half of the lamp bulb should be frosted or otherwise obscured from direct vision. Though this conception of a good lighting unit has been led up to in a somewhat elementary character, no apology is deemed necessary, since it is the keystone on which correct lighting is built up. It is also the one essential most frequently neglected. Almost any factory one cares to enter would furnish an example. Just as one cannot put new wine into old bottles without risk of disaster, so it is impossible to put modern lamps, more especially the gas-filled type, into obsolete reflectors and get correct tion. The lamp and its reflector m garded as one indivisible whole.

Comparatively recently standard lighting units have emerged, and type is now made by a number of turers. The illuminating and lig buting characteristics of these unit relied upon within the usual toleran mercial production, and it has thu possible for the illumination expert correct lighting installation to give determined quality of illumination w considerable degree of accuracy.

The installation of good lighting not of itself ensure correct illuminati unit will, for the sake of simp assumed to deliver downwards a con Actually the form of the light beam be conical nor well-defined, but th tion that it is so will help our explan the basic principle is the same in Now the intensity of the illuminati horizontal plane through the light vary with the actual distance from source. It will also vary at differ on any one horizontal plane, the tensity being in the area immedia the lighting source and diminishi goes outwards away from the cen

niform lighting is to be secured on g plane, and it is desirable in fac- workshops, apart from any addi- l lighting that may be necessary in es, that all the workpeople shall be e same quality of illumination—the vhich the lighting unit is suspended work is a matter for consideration. e case of two or more such units, they spaced apart that, with their cones erlapping, uniform illumination is the working plane, both directly lighting units and at any point te between them. Precisely the es as between two rows of lamps, ssential that a workman operating liately under but in the space be- rows of lighting units should not low on his work. This question of ghting over the working area is ntal requirement in the majority of is not necessary that the illumina- equal intensity throughout a work- nay differ in various bays to suit ments of individual classes of work. general lighting to make moving need not be of the same high s over a working area; special local ay also be required for some pur- t in any one area devoted to one work, uniform illumination is a n.

more than one way of securing uniform illumination. A small high candle-power units can be o give the same quality of light as mber of smaller units. But there ortant difference in the two cases. the number of light sources, the number of cones of light inter- th one another and producing a tensity over the area illuminated. nd machines, even the work itself, ich cases throw harsh, or black, shadows. This is usually a disadvantage. On the other hand, with a large number of light sources of lower candle-power, intense shadows will not be obtained, as the total illumination at any point is derived from many directions. Shadows will then be what are known as soft or "luminous." Even if it were possible to secure entirely shadowless illumination, it would not be advantageous to do so. Some difference in the intensity on the various surfaces of any object, such as, for example, the work itself, is necessary for its "form" to become apparent. We are now able to appraise the essential characteristics of correct illumination in factories and workshops—uniform lighting of high intensity throughout a working area by glareless light sources so arranged as to throw not harsh but luminous shadows. Reference is not here made to the lighting units, their height of suspension and spacing. They are only incidental, a means to an end—the delivery of the correct quali and quantity of light at the place where it is required. Necessarily much has been omitted that could be written on this subject, but we may add that the actual details of lighting installations may vary widely in different cases. Such details are hardly worth theorising over; they primarily concern the illuminating engineer in the application of his knowledge.

Good lighting costs money. So also does bad lighting; and the difference is small, out of all proportion to the benefits derived from the former. It has been proved by practical test that high-intensity correctly arranged lighting has a direct beneficial effect on the output of a factory. Here are some suggestive figures that can be vouched for on reliable authority. They relate to the average results obtained in the case of ten different industries. By increasing the average original lighting intensity from 2.3 to 11.2 ft. candles an increase in production of 15.5 per cent. resulted at an additional cost for lighting corresponding to a 1.9 per cent. increase in the pay-roll. Any new or improved productive machine that could offer but half as good a proposition would immediately have a vogue. The fact that correct lighting increases output is attributable to the greater ease with which it enables work to be carried on, the saving in actual time normally wasted in taking work under a lamp for inspection or measurement, and the direct stimulating effect high-intensity illumination has on the operatives, who are naturally getting fatigued towards the end of the day. There is another important factor that makes correct illumination worth while. Accidents during hours of artificial lighting occur at a far heavier rate than during the daylight periods of working. Thirty per cent. is about the measure of the increase, and this does not take into account the fact that hours of artificial lighting are far less than those of natural daylight. If the "Safety First" campaign one hears so much about means anything, it means that good factory lighting is not only justified but is a necessity in the interests of humanity.

In conclusion, the following figures, which give the minimum intensities recommended by lighting specialists for various classes of workshops will be interesting:—

Foundries—	Min. Ft. Candles.
All processes other than fine moulding and core making	5
Fine moulding and core making	10
Machine shops—	
For rough operations	6
For medium operations	9
For fine operations	12
Fitting shops—	
For rough operations	5
For medium operations	8
For fine operations	10
Drawing office	10

The above intensities are recommended as being justifiable on a strictly commercial basis.

SOME ASPECTS OF THE VENTILATION PROBLEM

ALD GRIERSON, A.M.I.E.E., lectured thern Polytechnic Institute, on this me time back.

ourse of his lecture he said the art cessful ventilation of offices, hotels, ns, theatres, workshops, and similar paces wherein human beings were, speaking, crowded together, was ne of the most difficult branches of .

building, dynamo and ship construc- ailway work, the material with which r worked was inanimate and consis- the finished products were more or ndent units. In ventilation work the ; equipment must be applied as an o a structure designed for a specific nd compromise was not infrequently Further, it had only been possible judge the result by the human senses, veryone knew, individuals varied or a very long time, indeed, certain d had the reputation of being bracing localities had had the reputation of a relaxing atmosphere, but so far logists had not been able definitely to indicate to the ventilating engineer d the fundamental difference between heric conditions in the two localities. other branches of engineering the ide was leading the applied side, ntilation it would probably be ad- engineers were leading physiologists. e ventilating engineers were prepared to supply, and to maintain in any pace, given the necessary facilities, any type of weather, from the coldest er, to a warm, humid day in summer, ere only waiting for the physiologists dise the air conditions that it was really desirable to maintain in given circumstances, in order to ensure the physical comfort and the health of the occupants. Since the majority of ventilating equipment was installed for the comfort and well-being of the human being, they might, with profit, devote a few minutes to considering it in detail from the points of view which chiefly affected the ventilating engineer.

It was a well-known fact, of course, that a steady or constant temperature could only be maintained in a mass of matter, living or dead, when the heat gained was equal to, or balanced, the heat loss, or output.

The whole problem was a particularly fascinating one, but in the short time available they must be content to accept the conclusion which a close study of the subject indicated. This was that excessive working of these heat regulating mechanisms of the body, caused by certain atmospheric conditions, produced feelings of discomfort in us in one direction or another, such as lassitude, headaches and ailments of a similar nature. Experiments showed that the rate of heat emission varied with the state of physical rest or work, and with the age of the person under test. For an adult male resting in bed it was as low as 275 B.Th.U.hr., and for the same adult walking at the rate of five miles per hour it was 3,030 B.Th.U.hr., or over ten times greater. The normal ventilation problem dealt, as a rule, with spaces in which people were at rest, or employed on light work, and the figure taken for heat emission was from 350 to 420 B.Th.Uhr., depending on the authority consulted.

The other products of combustion emitted by the human engine in the course of its run, of interest to the ventilating engineer or physiologist, were carbon-dioxide and water vapour. The volume of carbon-dioxide emitted also varied with the physical state, but in the above-mentioned conditions averaged 0.60 cu. ft. per hour. Water vapour emitted from the lungs appeared to average about 0.05 lbs. per hour, but they might rise to a value as high as 0.3 lbs. under certain circumstances.

So far they had only considered the total heat emission from the human body, but in order to be in a position to provide suitable weather by artificial means in occupied spaces, they must investigate the subject a little further in this direction, in order to ascertain, if possible, why they normally felt cheerful and fit on a bright day in spring, and depressed and feeble on a hot moist day in summer. Investigation and experience showed that the body lost or emitted heat in five ways, *i.e.*:—

Method.	B.Th.U.	% of total.
1. Rejection by waste products	7.9	1.9
2. Expired air	15.0	3.6
3. Evaporation from the lungs	31.3	7.5
4. Evaporation from the skin	60.5	14.5
5. Conduction and radiation	305.3	72.5
Total	420.0	100.0

Obviously the fourth and fifth methods, i.e., evaporation, conduction and radiation, which amounted to 87 per cent. of the total, were the most important factors, and those which were of primary importance to ventilating engineers.

The question of water vapour and relative humidity must be very briefly dealt with before they considered the question of the loss of heat by the evaporation of moisture from the skin. This was a slightly more complicated subject and was not so universally understood as the

CO_2 and heat factors of ventilation. It was, of course, a well-known fact that air was a mechanical mixture of various gases, ordinarily considered as consisting of oxygen and nitrogen, but also containing a small percentage of CO_2 and moisture or water vapour, termed humidity.

The weight of water vapour that a given space would contain depended entirely on the temperature and was entirely independent of the presence of air, except as regarded the effect of the temperature of the air. Relative humidity was the ratio of the weight of water vapour contained in a given space, to the weight of water vapour that the same space was capable of containing, when fully saturated at the same temperature.

Dew point was the temperature at which saturation was obtained for a given weight of water vapour, or the point when any reduction in temperature would cause condensation of some of the water vapour. Common examples were steamy windows and mirrors, tumblers containing cold drinks, slate shelves or walls, bathroom tiles, &c.

Any given amount of moisture had some temperature at which saturation will occur, just as any given quantity of water had a definite limited capacity to absorb alum. Any further lowering of the temperature will cause condensation. This—then—will be its dew point.

It was an established physical fact that heat must be absorbed when water or any liquid was evaporated, i.e., was converted or transformed from the liquid to the gaseous state; the commonest examples probably being those of a kettle, or saucepan, boiling dry, and the ammonia refrigerating machine. Contrary to the opinion commonly held, however, evaporation took place at all normal temperatures down to freezing-point. Those who served in the East during the war would recall the unglazed earthenware pots which, if filled with water and placed in a draughty place, rapidly cooled the contents, due to the evaporation of the moisture which soaked through the earthenware. In order, therefore, to ascertain the wet bulb temperature of the air they covered the bulb of an ordinary mercury thermometer with a clean, soft cloth, and arranged to maintain it in a moistened condition. A thermometer used in this manner would give a depressed or lower bulb reading than that of the dry bulb thermometer, in proportion to rate of evaporation from the wet surface of the cloth. The depression was a measure of the amount of moisture in the air. This depressed reading corresponded to the temperature at which the air would normally saturate, without any change in its heat content.

Dr. E. Vernon Hill, of the Chicago Department of Health, had carried out a very large amount of research work on the inter-related subjects of hygiene, ventilation and physiology, in an endeavour to answer the question raised in an earlier part of the paper, *i.e.*, What was the combination of Physical, Chemical and Physiological conditions of the air that produced a bracing or a relaxing climate or atmosphere?

One of Dr. Hill's earliest experiments was to obtain figures for the heat emitted by the human body, by evaporation, and also by conduction and radiation under varying conditions of relative humidity, but with a fixed wet bulb temperature.

Experiments on students and staff by Dr. Hill showed that a constant wet bulb of 56 deg. Fahr. gave general satisfaction for an average person in a state of physical rest and with the air practically motionless. Provision was made for increased heat emission caused by varying conditions of work by a slight alteration in the wet bulb temperature.

Conversely, as the air motion increased, it was found necessary slightly to increase the temperature of the wet bulb if conditions of comfort were to be maintained. These results were collected and were shown in the form of curves in the graph. Obviously, if it were found by experiment that these curves represented comfortable and healthy conditions, it was possible to evolve a method whereby the air conditions existing in any room could be compared with the standard conditions, and the variation, therefore, could be figured as a percentage error of the ideal.

Such a scheme had been worked out by Dr. Hill, and was termed the Synthetic Air Chart. This chart was divided into seven main columns, the figures for the first five being obtained by direct test, and for the remainder by calculation from observed results. The last column was the summary of the test, and showed the comparison of the results obtained, expressed as percentages of the ideal. The base lines of each of the columns represented 100 per cent. ideal conditions for the six main factors of the air, as they were known to-day, *i.e.*, it presupposed the most desirable relation of wet bulb to air motion; air entirely free from dust particles visible under a moderate power microscope, from bacteria and objectionable odours, unlimited in quantity and evenly distributed. The other extreme was at the top of the chart, and represented conditions that were so unsatisfactory that life would be maintained with difficulty, or would cease to exist. Perfect conditions were 100 per cent., and extreme conditions were zero. The eighth column was the summary of the others, and was completed by adding together the percentage penalisation obtained from the other columns and deducting the total from 100.

A comfortable, healthy room should show 95 to 100 per cent.; 90 per cent. was fairly good, 85 per cent. was only fair, and if the air condition showed only 80 per cent. immediate action was called for. If a 95 per cent. standard could be obtained without mechanical equipment, then there was no object in laying out capital on the installation of plant.

On the other hand, if an upward or downward fan system will produce the same result in a given building, when tested on the basis indicated by the Synthetic Air Chart, the system to be adopted would be decided on a financial and a convenience basis. Dust determination, with scientific accuracy was a matter of some difficulty and research. One method in common use now was to draw a volume of air on to a sticky plate. Counting was done under a cross-ruled screen in a microscope designed for a magnification of fifty diameters.

The determination of common aerabic bacteria, found in the air of rooms, was made by exposing standard 4 in. agar Petric plates in accordance with standard conditions. The plates were then incubated for 24 hours at room temperature, and the colony count was then made at the end of this period.

The investigation of odours was rather a difficult matter, since the only known method involved the human factor. Dr. Hill had analysed odours into nine different types, viz.:—

Aetherial, such as given off by fruits. Aromatic, such as camphor, citron and resinous substances. Fragrant, as of flowers and perfumes. Ambrosial, typified by amber, musk and bodily odours. Garlic, as found in onions, garlic, sulphur. Burning, roasted coffee, tobacco, smoke benzol, plenol. Goat, typical of this animal, by caproic or caprylic acid found in the sweat. Repulsive, given off by many narcotic plants or acanthus. Nauseous, or fetid odours from certain plants and from the products of putrefaction.

It might be of interest to note that the sense of smell was located in the upper part of the nasal cavity and covered a small area in either nostril. Odorous substances, to be perceived, must be in gaseous form; the gas entered into solution on the moist surface of the olfactory membrane and acted chemically on the sensitive hairs of the sense cells.

Many odours were certainly objectionable but whether they were harmful it was impossible to say with our present knowledge. Experiments appeared to indicate that odours caused a constriction of the blood vessels in the skin and that in all probability they did affect the blood-supply to the brain.

For the purpose of the Synthetic Air Chart, diluted solutions of varying strength of butyric acid were used to compare the strength of the odour. Six tubes were commonly use containing fine drops and termed 75 solution. The last contained distil and was termed 100 per cent. solutio

Regarding the very controversial Natural versus Mechanical ventil lecturer said he could not do better t from Dr. Hill Robertson's Report to t Department of Health, dated 19 making tests of air conditions in any g it was essential, above all things, tha standard of measurement or comp employed in order that the result value."

If they wished to determine the p sample of water, the accuracy of a wa speed of a locomotive, they must have with which to measure it, some standar lence for comparison, in order that might grasp the true significance of th was due to the absence of such a st ventilation work in the past that much of opinion had prevailed.

It was not unusual to hear well individuals condemn mechanical venti *se*, and to insist upon natural v methods, when the latter were totally in to maintain the air conditions required other hand, not infrequently mechani ments were specified, and installed wi were unnecessary and undesirable, a perfectly satisfactory conditions could tained by the use of windows or othe methods at a much lower cost a economical maintenance.

heat as radiation and the com-
t of this form of heat is experi-
ost immediately the radiator is
. and there is no need to wait until
of the room is warmed before the
comfort of artificial heating is obtained. In large mansions an excellent combination can be effected by utilising a solid or gaseous fired central heating installation to maintain a general temperature throughout the building of 55 deg. F.—60 deg. F., electric radiators being used to top-up the temperature to any degree required to meet the varying conditions from day to day. It is, however, self-evident that every heating proposition will have its own special conditions, and it is essential to consider these when planning the application of electric heat. Let us illustrate this by reference to a special problem—church heating.

Church heating is a difficult proposition at any time, and at first sight electric heating for this purpose might appear quite impossible. Probably, in the ordinary way, it would be dismissed without serious consideration. But so far from being an impossible proposition there are definite factors favouring the use of electricity for this purpose. First the character of the demand from the electricity supply point of view is good. The maximum load occurs on Sundays when most of the generating plant is usually idle; the amount of energy required is large; the demand is not of a highly fluctuating nature, and is continuous over long periods; and most important of all, possibly, it does not overlap the peak, or time of maximum demand on the generating station, to any considerable extent. Consequently, it is possible for the supply undertaking to sell electricity at a profit, for such a purpose as church heating, at a very low rate. A half-penny or three-farthings a unit would quite probably be adequate and, in fact, rates as low as this are actually obtainable in a number of supply areas to-day. Naturally this factor has an important bearing on the cost of heating by electricity.

The greatest advantage of electricity, however, is the method of its application. It delivers just the right amount of heat exactly where it is required without unnecessary waste. The object of church heating is to provide comfortable conditions for the congregation during the service, and to fulfil this purpose artificial heat must be distributed uniformly throughout every part. A system that has received the hall-mark of success in practical application is the provision of electric foot warmers to every seat in the building. Every individual in the congregation then has his or her own supply of artificial heat. Conditions of comfort are at a maximum, warm feet being essential in this connection. By suitably proportioning the loading of the foot warmers over or under heating is avoided. Separate foot warmers are not actually provided for each individual, but run continuously the full length of the pew. Aisles, vestibules, vestry, the choir, and other parts of the church, each have their own heating installation. (There is economy here in respect of choir practice, vestry meetings, &c., when only partial heating of the church is required.) Fully to meet the heating requirements the provision of electric heaters under every pew is not sufficient. Down draught from the windows has to be avoided, and this is done by installing electric heaters of suitable loading close up under the windows. Other special features are similarly met by direct application of heat at the point where it is required.

Consider an electric heating installation on the above lines in practical use. The heating ability of the equipment would be sufficient to meet the severest conditions experienced during the year. The installation having been designed with this in view when the conditions are less severe the actual heating requirements at any time are met by suitably operating the switch controls. Much heat is necessary to warm a stone church after it has been standing empty all the week. It is necessary therefore to switch on many hours before the service is due to start, maybe some time during the preceding night. An electric time switch previously adjusted can be utilised for this purpose. Regulation of the heating can be effected at any time by suitably manipulating the switch control, and there is very little time lag in respect of the reduction or increase of heat after the controls have been operated. This permits advantage being taken of the natural heating effect of the assembled congregation for the purpose of economising electrical energy consumption.

It is not suggested that the subject of church heating electrically has in any way been exhausted by these remarks. Enough has been said, it is hoped, to indicate some of the reasons why electricity can be utilised commercially for church heating. It has been done, and has proved very satisfactory and economical in many cases. Owing to the exact nature of electricity it is possible to determine in advance what the approximate cost of heating in a year will be with a reasonable degree of accuracy. In at least one case the maximum annual cost involved by electrically heating a church has been the subject of a guarantee.

advantage associated with high
s that they allow of thinner wires
being used for the purpose of supplying a given load, which results in economy on the initial outlay. In the case of bungalows and small isolated houses the lighting load of itself would be quite small and thin wires would, therefore, be used in the ordinary way. Generally in these circumstances 25 volts will represent the most economical pressure. There are, however, disadvantages, the chief of which, perhaps, is that as the battery voltage varies during discharge the intensity of the lighting will also fluctuate. Though this effect is negligible at the higher pressures usually employed, it may become appreciable and annoying at a pressure of only 25 volts. Further, 25-volt lamps are in the nature of special types, while if at any time it is desired to use an electric iron or other domestic device, such appliance must be specially designed for this pressure; normal stock sizes could not be used. Generally then such low pressures are not to be recommended except for the smallest installations.

Many country house plants have been installed for a 50-volt supply, but though this offers some economy in initial cost there is a good deal to be said in favour of 100 volts. The latter is a standard public supply pressure, and lamps, irons, kettles and similar small appliances for this voltage are stock articles. Also the possibility of a public supply becoming available in the district should not be overlooked as it would generally in such an event be economical to take advantage of it. If the original installation is designed for 100 volts pressure little or no alteration would probably be needed to adapt it to connect to the public mains. Depending upon the actual supply voltage and nature of the supply, d.c. or a.c., lamps and other current consuming appliances might or might not have to be changed. These factors need to be taken into consideration when determining the voltage of a country house installation. In some cases, such as large installations where there are long runs of cable or

where the generating plant is situated a considerable distance from the house, a pressure of 200 volts is quite likely to be the most economical. This again is a standard public supply pressure and, the installation being large and the cable-runs long, the use of thin wires would be a factor of economic importance. It is not possible to give any definite ruling as to the best voltage for any size of installation, as local conditions enter into the matter to a considerable extent. Where, however, 25 volts is too low the factors favouring 100 volts or 200 volts should be carefully weighed.

The battery is a most important part of the equipment, but, adequately to deal with, it would occupy too much space. It is advisable, however, always to instal a battery of ample size, and it is safest to confine one's choice to the products of manufacturers of repute. Cheeseparing in respect of the outlay on the battery is generally unwise economy. A large battery worked well within its capacity will obviate much trouble, and will save expense in maintenance and renewals. A safe standard would be to instal a battery of such size that the work imposed on it will not wear out the plates under a period of ten years.

Small and medium-size generating sets up to several kilowatts employing petrol, or paraffin engines for the prime movers are available in three types, viz., automatic, semi-automatic, and non-automatic or manual operated. The completely automatic plant is arranged to start up when the load exceeds a predetermined value, and to shut down when the load falls off again without human intervention. Such units will give very satisfactory service so long as everything is all right, but there is the drawback that in the event of a fault developing skilled attention is usually required and will probably not be immediately available. The semi-automatic set which is started up by hand to charge the battery and shuts down of its own accord when the battery is fully charged is more widely used. In either case it is desirable that the automatic switchgear be as simple and reliable as it is possible to make it. Hand-operated plants are controlled throughout by the plant attendant. Skilled attention is not involved, however, as the simplicity of these sets is such that they can be left to the care of the gardener, or odd-job man, after a little instruction in their manipulation.

There is a large variety of plants of each of the above three types available, and they differ widely in respect of price. It has already been indicated that voltage and the size of battery used are two important factors affecting cost. A third is the speed at which the sets operate. Generally speaking, very high speeds allow of cheaper manufacture and, it may be added, involve greater wear and tear. But it must not be overlooked that both petrol engines and electric generators are established as reliable high-speed machines. The general tendency in American practice is to favour high speeds up to several thousand revolutions per minute, and in British practice relatively low speeds.

For medium-size plants up to, say, 10 h.p. very satisfactory service can be obtained from gas or oil-engine driven sets. The former almost presupposes the existence of an available town gas supply, as otherwise suction gas plant would be necessary, when the oil engine may be taken as the better proposition. Where a large plant is in question and skilled attention is available, however, it must be admitted that a suction gas plant gives satisfactory and economical service. Oil engines may be either of the horizontal or vertical types, and either of slow (a few hundred revolutions per minute) or comparatively high speed. The former naturally occupies greater space, but a horizontal type oil-engine direct coupled to a slow-speed generator undoubtedly represents a very sound combination likely to involve little trouble in repairs and maintenance. Belt drive to a relatively high-speed generator enables economy in initial outlay to be high-speed generators being cheaper facture—and this generally does no cate matters to any appreciable exten are a number of relatively slow spee oil engines, including types run paraffin, of reliable make available, would naturally be favoured where limited. With vertical-type engines a or belt drive may be employed.

As the capacity of the plant inc becomes more and more important provision for putting the plant in by other means than hand-startin usual method is to run the genera motor, taking power from the batt it is up to speed, when the engine co action. This, of course, is what is d automatic sets and is, in fact, quite mon feature with all types of unit as one kilowatt capacity or less owi great convenience. It involves only simple switching problem.

For large installations up to and e 25 h.p. the choice of prime movers is to include heavy crude oil engine Diesels, and suction gas plants. Us such cases skilled attention would be a and satisfactory and economical o would be influenced to a greater exten human factor.

Finally, a word as to water power. are undoubtedly quite a large number streams in this country now running which could be usefully and economica nessed to develop electrical energy lighting and power requirements of mansions, villages, and even small tow It is surprising and regrettable that advantage has not hitherto been take opportunities for cheap generation whic streams offer. The subject of water development is a very wide one and now be discussed, but it is urged t possibilities of utilising this source of should never be overlooked or neglect

WIRING SYSTEMS

In recent years the number of wiring systems has multiplied to an almost phenomenal extent. So much so, in fact, that to-day there is an undoubted embarrassment of choice. Correctly to differentiate between the special technical features of the various systems and to select one that will best meet the requirements in any particular case is specialists' work pure and simple. It is not to be undertaken without sound knowledge and wide experience; it is a function fulfilled by the electrical consulting engineer. We do not wish to be misunderstood to say that there is one best system for every job. Actually there may be half-a-dozen or more different systems, with any of which it might be possible to carry out a first-class installation in a given case. In dwelling-houses, for instance, almost any system, in the hand of a conscientious contractor and skilled workman, would give satisfactory results. On the other hand, there may be one system particularly well adapted to the special conditions of a certain installation, and therefor the best for that case. It is not always technical features that decide the choice of system. Inconspicuousness, ease of installation without damage to existing decorative or structural details, cost, and so forth, may be the determining factors. All of which remarks only go to emphasise what has been stated, that electrical installation involves specialist work, and that co-operation between the architect and the electrical engineer is essential if the best results are to be secured. Having made this point clear, we may proceed with the main purpose of this article—to present a general review of the various classes of wiring now in vogue.

Wood casing was one of the earliest systems developed, and was extensively used. It consists essentially of vulcanised rubber-insulated wires laid in grooved wood casing to which plain or ornamental wood capping was screwed, to enclose and protect the wires. Generally, the casing was run on the surface and, compared to modern surface wiring systems, was bulky and unsightly. For dry situations it constitutes a very satisfactory and quite cheap system, and it represented standard wiring practice for many years. It is to be avoided in damp situations or buildings where vermin are likely to be present. In certain respects wood casing has points of superiority over all other systems, but its two great drawbacks are its inflammable nature and inability to resist damp. The need for greater protection against mechanical damage, the chance nail, and fire, however, led to the advent of the conduit system.

Conduit Installations replaced wood casing as the standard form of wiring, more particularly for new building work, where the position of lights, switches, etc., can be determined prior to construction. In one form or another it is the most widely used system to-day. Enamelled tube conduit, the various sections of which are connected together with coupling pieces, entirely surrounds the vulcanised rubber wires, which are usually drawn into the conduit after the latter has been fixed in position. In effect, the whole of the wiring is metallically encased in every part of the installation. It is very important that the whole of the conduit be electrically continuous throughout, and that at one point it should be effectively connected to earth, as this provides a large measure of safety in the event of electrical bre Failure of the insulation will allow el to pass from the conductor to the which then becomes electrically alive. conduit is electrically continuous thr the resistance to the flow of current will be low, which will allow a su large current to pass to blow the fus particular circuit on which the fault to be. The faulty circuit will then dered dead, and the risk of electrica fire, etc., eliminated. If the resistanc path of the current flowing to earth i due to the conduit not being prope tinuous—much damage may be done currents before the fault is finally There is also the risk of shock to touching a live section of conduit. I couplings and screwed couplings are connecting the sections of conduit the latter being obviously preferable point of view of securing good co When slip couplings are used some continuity grip device is necessary joint, and this, naturally, does not le to such high-class work as screwed s duit. There are several types of con may be solid drawn, brazed, welded, split tube. Solid drawn steel cond screwed couplings represents the standard of quality. Owing to its and ease of erection, split tube con slip-on couplings has enjoyed a wide p Excellent mechanical and electrical and practical elimination of fire characteristic of conduit wiring pro ried out; where the wires are drawn the conduit is fixed the system lends

r fixing the cables in position, neat thin metal holding clips are used at short intervals throughout the run. When erecting, these clips are first fixed in position to the walls or other convenient support by means of pins, screws or dowels. The cables are then placed in position and the clips only have to be bent over in the right way to hold the cable firmly in position. It will be readily appreciated that cables of this type, fitted in the manner described, involve the minimum of damage to existing decorations, very little or no cutting away and making good is necessary, and since the work of erection is very simple, time and expense in installation are saved. Further, the semi-flexible character of the cables allows of their being bent round corners, adjusted to cornice curves, etc., with ease. Where the cables are run in positions exposed to mechanical damage, additional protection may be afforded by steel channel sections or such-like methods. Steel channel sections are also used in some cases to support the cables carried across the ceiling, with the object of avoiding unsightly sagging between points where the cable is supported. The same characteristics of neat appearance and simplicity are aimed at in the design of the accessories, such as junction boxes, earthing devices, etc., which are necessary to complete an installation. A common form of junction box consists of a thin metal backplate fixed in the required position by a single screw, and a similar cover either fixed to the backplate by a screw or arranged simply to clip on. Jointing of wires within the box is commonly effected by means of simple porcelain-sheathed connectors. Provision is usually made to allow cables to be brought into the box at any position, thus securing complete flexibility in this respect. While the lead, or other, sheathing of the cable ensures excellent electrical continuity throughout any one run, long or small, special provision must be made for bonding at all junction points. This bonding is a point that needs special attention in any metal-sheathed surface wiring system. In some cases the junction box itself is utilised as a bonding link, in others special bonding clamps of simple designs, easily fixed, are employed. The earthing bond is also an important feature.

From this brief description some idea may be obtained of the general characteristic of metal-sheathed wiring systems, and also the advantages they possess in respect of cheap, simple and inconspicuous installation. The actual design of the accessories is the chief feature of difference between individual makes. Such systems are widely used to-day and are increasing in popularity as their intrinsic merits become better known.

Cab-tyre-sheathed and tough-rubber covered wiring systems are similar in general principle to the metal-sheathed variety, but a covering of tough rubber compound similar to that used for tyres of cabs replaces the metal sheathing. This covering possesses extraordinary resisting properties to rough treatment, and is unaffected by being exposed to paint, moisture, wet plaster, acid and chemical fumes, and such-like corrosive atmospheres. The cab-tyre cables are secured to walls by clips in a manner similar to that described when run on the surface. In common with metal-sheathed cables, they may be buried in plaster or brickwork, or run concealed. They possess the maximum of flexibility, and in addition to being widely used for all ordinary installation work, are particularly well suited, in conjunction with corrosion-proof accessories, to such situations as chemical factories, breweries and the like. As indicating the wearing properties of cab-tyre-sheathed cables, it may be mentioned that they are used with much success for hand-lamps, portable drills, and similar tools in factories.

Some patent wiring systems make special provision, by means of coloured exterior braiding over the lead-sheathing or by neat wood beading which may be stained and polished, so that the installation may be made to harmonise with any existing scheme of decoration. Very neat and inconspicuous work is thereby made possible.

GAS CONFERENCE.

Wade Deacon, presiding at the
ion of the British Commercial Gas
Conference, at Liverpool, said that
s should take the lead in attempting
ployers and employed together, with
ting up machinery for the prevention
nd lock-outs.

p of Liverpool welcomed the sugges-
expressed the hope that "Copec"
e means of giving it practical effect.
ne said, take a generation or two
d the mistake of the old economists
the labour of men on a level with
rial things. Completely human
industry would be attained when
tributed labour of brain and hand,
or led, understood not only their
ontribution as part of a great whole,
ood each other. He expressed his
oval of co-partnership, which was
e operation in the gas industry.
commended the enterprise of the
in the education of adult workers,
d the hope that part-time continua-
would become universal, and that
levelop on the lines of public schools
es.

Deacon, in thanking the Bishop,
ls had been made that there should
the industrial world. If there were
e, there must be some organisation
d settle matters of wages and
without strikes and lock-outs.
l that the Church might take some
s matter. It would be a blessing to
if the leaders of the Churches—
d Roman Catholic and Free—
about a conference between the
the employers. Unless something were done to stop the strife in industry, the country would be in a very dangerous position in a few years. Although some people deliberately fermented trouble, the great majority of employers and employed were reasonable, sensible, and honest men.

Sir Lawrence Weaver, speaking on "Art in Industry," contended that industry, as the great source of wealth, had a very substantial duty to support the fine arts as well as the applied arts. Such great buildings as Liverpool Cathedral had to be financed ultimately by industry. When they considered the devastating blight of ugliness which the industrial developments of the nineteenth century laid upon this land, the public had the right to demand something in return from the industrialists who had now learnt better things. A community got the measure of ugliness in common life that it deserved, just as it got the government it deserved. Industrial people had got to support the artist, otherwise beauty would die out of the world. The Commercial Gas Association had a clean record in that matter because they had encouraged art in their publicity campaigns. The only really entirely satisfactory piece of commercial publicity at Wembley was the gas exhibit, because it was the only piece of publicity which had entirely suppressed the individual and had simply set out to make a fair, beautiful, and persuasive picture of an industry.

Sir Lawrence went on to plead for seemliness in common things and for the kind of art that everybody could understand. Real art was no more costly than ugliness. Art was not a coating applied to things normally base and ugly; it was a character in things and not something stuck on the outside. There was no reason why all the things they employed in industry should not be seemly, decent, and pleasing.

Mr. Lawrence D. Holt, in proposing a vote of thanks to Sir Lawrence Weaver, said they must unite to fight the smoke fiend, even if they had to put themselves under a penalty. As a shipowner, he regretted that the shipowners had asked Parliament to exclude ships from the ambit of the new Smoke Abatement Bill. The reason given was that they could not impose these domestic laws on foreign ships without causing irritation. Mr. Holt contended that all the new houses which were being built by municipalities should be smokeless houses.

The Chadwick Lectures.

The Chadwick Lecture Programme for this autumn includes lectures in London on "Defective Hygiene and Child-Life," with special reference to the effect produced on growth and development of children by town dwelling and slum areas, by Dr. Lawson Dick, M.D.; "Rats," by Dr. Mark Hovell, F.R.C.S.; "Smoke," with a review of its causes, its effects on vegetation, fabrics, masonry, and metal work, and its influence on health and the death-rate, by Professor J. D. Cohen, Ph.D.; and "Ante-Natal and Post-Natal Child Physiology and Hygiene," by Dr. W. M. Feldman, M.D. Each lecture will be illustrated and among the chairmen will be Sir William Collins, Chairman of the Chadwick Trustees, Sir J. Crichton Browne and Sir Frank Baines. Further information about these lectures, which will be free to the public, may be obtained of the Secretary, Mrs. Aubrey Richardson, at the offices of the Trust, 13, Great George-street, Westminster.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Abandoned Work.

SIR,—Can you inform me whether an architect and quantity surveyor can claim the full fees for quantities upon abandoned work, in a district where it is the general practice to prepare them, if he has not actually obtained the client's instructions to prepare them, but merely to obtain tenders. If one could forsee differences of opinion, one would naturally enter into the matter in detail at the outset, but so many jobs go through without question that it becomes a habit to assume that the general public is familiar with the methods of local practice. "BITTEN."

Size of Bricks.

SIR,—I have noticed of late that many of the bricks in this part of the Midlands are slightly thicker than those obtaining before the war. The difference is very slight, amounting to little more than ¼ in. in seven courses. The opinion has been expressed in my hearing that it is due to the urgent pressure on the brick-making industry leading to rather less burning than of old. Is there anything in this suggestion, and, if so, is the quality of the brick likely seriously to suffer in consequence?

"GAUGE."

Incinerators.

SIR,—As a reader of your paper, I am taking the liberty of writing to you to see if you can help me in the matter of building an incinerator suitable for the burning of refuse from a sanatorium. They would like me to build one in an open field where there is no chance of obtaining any forced draught, and they will not go to the expense of a chimney-stack. The amount of refuse to be burnt is about three dust-bins a day, and is of a green wet nature. I thought perhaps one of your readers might know the type that proved best in the Army. JOHN GABBERTAS.

Raising of Party Wall.

SIR,—For some years before the war I was an architect and qualified as A.R.I.B.A. in 1912, and was a constant reader of *The Builder*. I am now in a difficulty regarding a question of the raising of a party wall and would be grateful if you would help me with your opinion. I am the owner of shop premises and I wish to carry out extensions at the rear of same. My neighbours have a tenement at the rear of their premises with a rain-water gutter overhanging my yard, but emptying into their yard, as per sketch (No. 1). This gutter has been in existence many years and is possibly a "right." Their tenement roof is in a very bad condition, having been grouted frequently with cement and tar, but is apparently water-tight.

Query (1) My neighbours demand that if we raise the dividing wall (which they agree is a party wall), necessitating disturbing the eaves of the tenement roof, we must re-slate the whole of both slopes of the roof and, if necessary, provide new rafters, battens, &c.; in fact, provide a new roof in place of the old one. Is this a legal demand? Is it not legally the case that we must only replace in a workmanlike manner and make water-tight the actual part of the roof which we disturb—in this case the slating at the eaves, and provide, of course, a lead gutter against the raised portion of the wall?

Query (2) If it is considered the overhanging gutter is now a "right" have my neighbours the "right" also to demand access to the gutter from my yard? or can I build a wall past the gutter (as per sketch No. 2), which would entail any attention to the gutter being given from their roof?

Query (3) My neighbours also demand that the party wall shall be raised full thickness and shall still be a party wall when completed. Have I not the right to build up for only half the thickness on my side—the raised portion being my property and not a party wall?

Query (4) Can I carry out my intention of removing the gutter and raising the party wall for half its thickness without agreeing to the unreasonable conditions imposed by my neighbours?

J. B.

Estimating Quantities.

SIR,—In estimating the quantities of bricks, breeze slabs, roof tiles, flooring, and other building materials in bulk for ordering purposes, can you inform me what allowance in each case is usually made for breakages, waste in fixing, &c., over nett superficial measurements as given in Bill of Quantities?

"QUANTITY SURVEYOR."

Brands of Timber.

[Messrs. *The Timber Trades Journal* inform us that for a number of years they have been publishing a book entitled "Shipping Marks on Timber," which should be of help to "Cautious." The latest edition is out of print, but a new edition is in course of compilation.]

Grano-paving.

[REPLY TO STUDENT.]

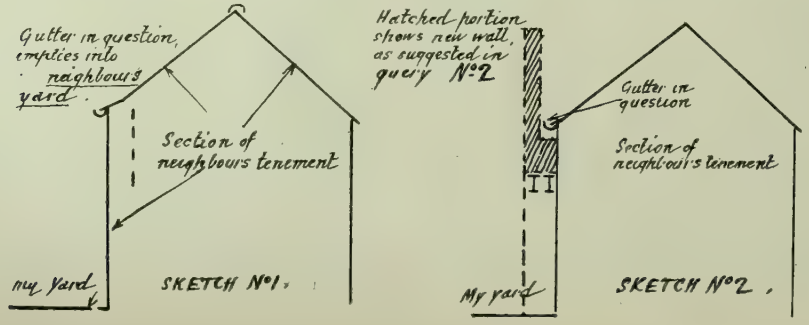
SIR,—The operations of beating up cement after it has once set, and of scouring the surface of granolithic cement under like circumstances, are not quite parallel. In the first case the re-used cement mortar is handled as though freshly made, and having passed through a chemical action, its efficiency is destroyed.

The purpose of scouring the surface of granolithic cement, on the other hand, is twofold—(1) to acquire thorough homogeneity through pressure, which would be impossible by hand trowelling over a fluid surface, and (2) to produce an extremely fine surface, which can be produced the better upon a mass as it approaches solidity, just as it is the harder stone that takes the better polish.

It is not a question of beating up the whole bulk of the paving, but merely a surf ment.

"INTERE

Rough Cast.



SIR,—Can any of your readers giv recipe for cement and granite rough is desired to avoid the drab grey cement tone, and the result aimed at grey colour in which the sparkle particles is a little in evidence.

"S

Building Paper.

SIR,—Can any of your readers in through your columns as to the makers o Paper Pioneer No. 1, or equal? If we shall be glad to forward samples o require.

"CONT

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wed*

PARLIAMENT reassembled on Tuesd tember 30, to pass the Irish Bounda mission Bill.

Rent Restriction.

Mr. N. McLean asked whether it intention of the Government to legislation to bring the rents of pre-wa to pre-war level?

Mr. Clynes said that the whole qu Rent Restriction was receiving the cons of the Government as an urgent matte

Mr. D. G. Somerville: Will the r gentleman try to introduce legislation the cost of repairs back to what they 1914?

Mr. Clynes: That is a subject whi not be considered without the matte by the first question being fully dealt w

Local Authorities and the New

Mr. Wheatley informed Mr. Strau since the Housing (Financial Provisi was passed on August 7 last, m authorities had been in recess, and t not been sufficient time for local autl formulate completely their proposals new Act. Local authorities had been to frame their policy so as to provide tinuous house building, and, in ad submitting proposals for immediate to adopt programmes for work wh would be able to carry out effective the next two years. He would be gla the House from time to time as information as possible.

Number of Apprentices.

Mr. E. Simon asked the Minister whether he had taken the necessary have a return made at regular interv number of apprentices in the buildi and whether he would arrange for su to be published at intervals of not m month?

Mr. Wheatley said that steps were b to set up the Industrial Committees had foreshadowed in connection housing scheme and, as part of th ments, he hoped to provide for the supply of statistics as to the numbers tices.

Rebuilding in France.

A book, entitled "Five Years has recently been issued by the once areas of France. Among other thin that of the 22,900 industrial bui troyed, no fewer than 20,872 have b structed. Of 200 pits destroyed, 1 working. Of the 742,000 houses and buildings destroyed, 605,000 have b

THE BUILDING TRADE

NEW METHODS OF COTTAGE CONSTRUCTION

r to get a large number of small ilt in a short period of time a great tention is now being given to new and new methods of building. The ow is much the same as it was first post-war Government housing as launched: the need for houses has ished; the number of skilled men has not increased; there are still gh bricks being manufactured at meet the requirements of such a ramme. Since the "Addison" as abandoned owing to the height the cost of building had soared uses, perhaps the chief of which is ce of demand, have led to the price rking-class dwelling being reduced top figure of over £1,000 to some- ut £500, and it is probably the fear s will again increase when the new put in operation, and the demand exceeds the capacity of the industry materials and skilled labour is con- hich is responsible for the anxiety Government to discover alternative providing cottages.

new materials advocated steel is at receiving the most attention. We yet had an opportunity of seeing ese houses, and without further par- han the meagre information which published it is impossible to give an n them, but a proposition put for- Lord Weir deserves close attention. we can gather the houses are built frame covered on the outside with es and with wallboarding and bitu- aper inside; chimneys are of rein- ncrete, and the roof of asbestos-cement rafters. No doubt such houses could d very rapidly, providing they are not such large numbers that the steel- nnot keep pace with the demand, in se the steel house would be as diffi- btain as is the brick house, but it is that the manufacture of the units ave to be on such mass-production t the resulting standardisation would cceptable to most people.

ly other material being advocated to nt is concrete. Many thousands of ave already been built with this with the walling either monolithic form of piers-and-panels or hollow locks. The chief advantages of this are that suitable sand and coarse may be found in practically every and often on the housing site itself, iding delay in obtaining materials sport charges, and that local labour nt receiving unemployment pay or ms of relief can be quickly trained n concrete, but as to cost the saving alling does not often exceed 10 per the total cost of the house.

years ago there were some two hun- erent systems of concrete construc- advocated, and most of these were by the Ministry of Health; not more ozen or so, however, were used for cottages to any extent, and now, as f experience, many of these systems n abandoned. The systems which rived may be divided into three dis- sses, namely, walls poured *in situ*, ted at intervals around the building in with slabs, and either plain rect- locks forming a wall in two leaves vity between them or hollow blocks thickness of the wall. In the first scheme blocks in one form or an- e used almost exclusively; later, the pier-and-panel system was extensively used; monolithic walls were used in but very few districts. It seems now, however, that the order in which these methods find favour has been altered, and in schemes now in course of erection the pier-and-panel system is probably being more extensively used than blocks; concrete cottages with monolithic walls are still not being built to any great extent.

One of the chief causes of the diminution in the use of concrete blocks for large schemes is no doubt the extra cost entailed by the trade union rule which requires that the laying of concrete blocks comes under the heading of bricklaying, and that bricklayers must be employed for the work, while there is also a considerable amount of unskilled labour required for the manufacture of the blocks, carrying them away from the machines in which they are made, keeping them watered while they are curing, and carrying them back to where they are wanted for erection. This can be eliminated by purchasing the blocks already made and cured in a factory, but as factories for the manufacture of concrete blocks on a large scale are not in many parts of the country conveniently situated the cost of transporting the blocks would, in many cases, make this a more expensive procedure than making them on the site. However, thousands of cottages have been built of concrete blocks, and in nearly all cases have worked out cheaper than brick.

The pier-and-panel system was designed to eliminate the necessity of employing bricklayers and to simplify manufacture of the units. Concrete piers, usually reinforced, are erected at intervals of about 4 ft. around the building, and the spaces between them filled in with slabs measuring 4 ft. by 2 ft. high by about 3 in. thick. The piers are made with parallel grooves throughout their height on both sides, and in these are slotted tongues cast on the ends of the slabs. A cavity wall is thus formed without mortar joints, the outside being roughcast or rendered to hide the joints and to make them weatherproof. This system may be cheaper because no skilled labour is employed on the walling, and because the plain slabs required are simpler to make than the sometimes complicated forms of hollow blocks, and also because owing to their larger size fewer are wanted, but to get the cheapest building a certain amount of standardisation is necessary; the most economical use of the system is to build all the houses exactly alike, every deviation from the standardised pattern adding to the cost.

Monolithic concrete walling for cottages has not been used to any great extent in this country, although in America it is perhaps the most usual method. The Edison method of pouring whole streets of houses at a time no doubt has considerable possibilities for cheapness; but here, again, the same moulds have to be used over and over again, with the result of monotony and sameness, if it is to be put to its most economical use. This method also involves the use of hoisting and placing plant, as the whole of the houses even to the picture rails are poured from the top, which would not be economical except on very large schemes. Besides the Edison method, however, there are several other systems of monolithic wall construction which could be applied to small house erection by which one house or any number of houses could be erected with a minimum of plant. One of these methods uses sheets of galvanised iron which revolve outwards and upwards from the ground level to the top of the wall, the wall being built in courses about 2 ft. 6 in. deep. Another makes use of a mould about 3 ft. long by 2 ft. deep, so built that it travels along the wall. Another method, and one which seems to have considerable possibilities, uses moving shuttering of the type used for silos; the cost of shuttering is reduced to a minimum, as a piece of timber 15 in. high is all that is necessary to carry a wall to any height, and of a length corresponding with the length of timber. These and other similar methods permit of rapid construction with a minimum of plant, and if a mesh or similar reinforcement is used vertically throughout the wall it is possible for one man to pour a dense impervious concrete for the outside of the wall and another simultaneously to place a breeze concrete to form a porous inside wall. It is claimed that by the use of sliding shuttering the walling of any number of houses can be built in three days at a cost 25 per cent. less than brickwork.

It may be useful to sum up the methods of construction with these three methods of concrete construction:—

Concrete Blocks.—Made in a machine or wooden mould, carried away and kept moist for two weeks or so while curing, then built into the wall (usually bricklayers have to be employed). Size generally 18 in. by 9 in. by 4½ in. when solid blocks are used to form a cavity wall; smaller sizes made to follow the architect's design when necessary. Hollow blocks are usually 18 in. by 9 in. by 9 in., and smaller sizes made when necessary as with solid blocks; the hollows are usually formed so that there is a continuous flow of air throughout the wall. Cavity walls are formed with dense blocks for the outer leaf and breeze blocks for the inner leaf. Hollow blocks are generally made of an impervious concrete throughout, and the air flow through the cavity is often relied on for the prevention of condensation on the inside. Surface either roughcast or left with the blocks and joints exposed; the surface is often relieved by forming the blocks with an imitation rock face or by a ribbed surface; sometimes colour is imparted to the blocks by incorporating a colouring material with the concrete when it is mixed or by the use of coloured cement purchased from the cement manufacturers.

Pier-and-Panel System.—The piers are built *in situ* or pre-cast and erected in position after curing; in either case they are generally reinforced with three or four vertical steel rods. Panels are made on the site, usually in wooden moulds made by the contractor. No skill is required to place the panels in position, as they are simply slotted between the piers and held in position with a tongue and groove joint. In some of the systems no mortar is used. Cavity walls are used, sometimes with impervious concrete on the outside and porous slabs inside. It is necessary to render the outside surface and push the cement well into the joints between the slabs and between the slabs and the piers, in order to make the walls weatherproof. The greatest economy is obtained by a certain amount of standardisation, otherwise it may be necessary to erect piers closer together than is necessary and make the slabs in different sizes.

Monolithic Walls.—Apart from methods where whole streets are cast together, houses may be built with monolithic walls, reinforced or not as desired, without standardisation of design and without a great deal of shuttering. Climbing shuttering, travelling moulds, or moving forms may be in small units, and as no piers intervene window and door openings may be placed in any position without extra cost or cutting formwork to waste. Cavity walls are formed by placing boards or sheets of metal in position within the shuttering, and held apart by distance pieces, before the concrete is poured; as the wall gains in height

this inside shuttering and the distance pieces are raised ready for concreting the upper part of the wall. A vertical dampcourse may be inserted throughout the height of the wall, or a mesh or other reinforcement placed in position and concreted in; when such a dampcourse or mesh reinforcement is used pouring can take place simultaneously from each side of the wall, and a dense concrete used on the outside and a porous mixture on the inside to prevent condensation. Walls built on this system may be roughcast or left as they come from the shuttering. If wooden shuttering is used the surface may be broken by fixing strips of wood or blocking-pieces to the inside of the shuttering. A perfectly flat surface showing no marks of shuttering can be obtained by the use of steel shuttering. There are also many methods of treating concrete surfaces with pleasant effects. The method usually adopted, because it is the cheapest and simplest, is to wash off the film of cement which works up to the surface while the concrete is setting and exposing the aggregate of which it is made. With climbing shuttering, travelling moulds, or moving forms this is a simple matter, as the shuttering is removed from the face before the cement has finally set, and the film can be brushed from the surface with water; if the concrete has set the cement is removed from the surface by acid or by chipping with a hammer. This method of surface treatment opens up wide possibilities, as the colour may vary from white, if a white aggregate such as marble chippings and a white cement are used, to black if black marble chippings are used with a cement coloured black. Marble chippings are, of course, out of the question for cottage building, and are only mentioned to show the range of colours and shades which can be obtained by using different aggregates or combinations of aggregates; when it is remembered that only the aggregate of which the concrete is composed is seen on the surface it will be realised that cottages built of granite aggregate in a granite country will look like granite, and cottages built of concrete with a flint aggregate in a flint country will look like flint.

A number of houses have also been erected with a steel frame filled in with concrete, either poured or in the form of slabs; this system comes within the heading "Pier-and-Panel Systems" above, the only difference being that a certain amount of site work in marking concrete piers and carpenter's work in making roof trusses and floor joists are avoided. Cottages are also being erected with concrete plastered on both sides of mesh reinforcement, no shuttering being used.

From this brief survey it will be seen that the Committee now sitting has much material to work upon in the thousands of cottages which have been built of materials other than brick during the past few years, and as these various methods of building have all been produced within such a short time it is probable that in the course of its investigations other methods will be discovered with even greater possibilities. Obviously 2,500,000 houses cannot be built within the next fifteen years with brick, but in the search for new materials brick will, of course, not be overlooked. Until the outbreak of the war brick was used almost entirely for small house construction, obviously because it was the cheapest and best material then known. Present difficulties are due in large measure to the shortage of bricks and bricklayers, not to anything wrong with the method. We have been told that because they have been in use since the time of the Pharaohs it is time bricks were scrapped in favour of something new, but because a thing has been in use for a long time it does not follow that it is of no use any longer. In fact, the experience with newer forms of cottage building prove that under normal conditions there is no cheaper or better material than brick, for even when no skilled labour whatever is used in the erection of the walling of a cottage and the materials are found locally there is hardly ever more than a saving of 20 per cent. in walling. It is only the present higher wages of the bricklayer and the increased cost of bricks which enable savings to be effected by the use of other materials; it is more than probable that if similar houses were built of brick and one of the new methods under pre-war conditions of wages and prices of materials there would be no saving at all. However, under present conditions there are certainly cheaper methods of building sound, weatherproof, durable, and comfortable houses than by brick, and undoubtedly the new methods will play a large part in the housing programme when it is put in operation. It may be that an effort to increase the output of bricks while the apprentice-bricklayers are being trained under the agreement between the Government and the building industry would make it easier to build many of the new houses in brick, especially in districts near brickmaking centres where transport charges would be low.

Since the above was written, we learn that Mr. Wheatley and the members of the Committee which is considering new methods of cottage building have visited Glasgow and inspected three new systems, namely, Lord Weir's timber and steel cottage, which was erected, under factory conditions, in "three or four hours," and the price of which is given at £300 per house if over 1,000 are built on one site; a house built by Messrs. Beardmore for the Duke of Atholl, which is constructed of outer walls of steel three-eighths of an inch thick and inner walls of asbestos-cement; and a cast-stone cottage, built by Mr. John MacDonald. We learn that the members of the Committee were "greatly impressed" with these experimental houses, but no further technical details of the methods of construction have yet been published.

INDUSTRIAL PEACE ARBITRATION

In the Prime Minister's speech at Derby in connection with the proceedings at Geneva and the League of Nations there was contained this significant passage: "The thing we have to do is to outlaw war. Until the nations of the world discover some particular act which can be taken by universal consent as the test of aggression you will always have war. The Labour Party made its contribution to what that act of aggression by common consent ought to be and it is this—a refusal to submit to arbitration."

That, according to the Prime Minister, is the attitude of the Labour Party to peace in the international sense. Peace at home in industrial matters is hardly less important and this pronouncement of the Prime Minister appears equally applicable to industrial disputes. What by common consent should be deemed an act of aggression? The refusal to submit to arbitration. The Minister of Labour, in a pamphlet entitled "Labour and Industrial Peace," touches on the question of arbitration and says it is becoming more and more a practical method of settling disputes, but he says, "It seems absolutely impossible at the moment even to dream of any compulsion." That was the attitude of the Trade Union Congress towards arbitration.

The Minister of Labour, however, in the above pamphlet speaks of the value of Courts of Inquiry, as on inquiry the facts are laid before the public and "public opinion still is a tremendous force with both employers' organisations and trade unions." We do not know why the word "still" occurs in this passage, as we presume it is not intended to nationalise public opinion, but we desire to make the point that if the views expressed by the Prime Minister as being the opinion of the Labour Party on international questions are applied to industrial matters a long step will have been made towards compulsory arbitration before a dispute is followed by a lock-out or a strike.

In every dispute nowadays public opinion is invoked and there is propaganda to secure public favour. Let the public accept the easy dictum of the Prime Minister that a r submit to arbitration indicates the agg the dispute, and it will make arbitrat pulsory in fact, for the aggressor in dispute who has neglected to try me conciliation will know that it is vain f play to the gallery and obtain public su sympathy.

The public desire peace and there is ment at the moment to secure it. In p the trade unions have found that a aggression rather tends to increase their ship and they have discouraged co-pa schemes and arbitration because, as often asserted, it saps the loyalty members; but public opinion has ripene the past few years, and if public opinio force attributed to it by the Minister o it seems not too much to hope that in t the trade union which strives to adopt methods will find its membership more than can ever be the case by militant m

At any rate, the public has a simple before it in every dispute as applied Prime Minister to the nations: Wh aggressor?

NEW BUILDINGS LONDON

Vauxhall.—Work has just started erection of an extension to the Brabazon Ladies' Hostel at Vauxhall Bridge-road, The new building will be of five floors an ment, providing an additional 26 bedroom bathrooms, lavatories, a lounge and re office. Costing £12,000, including equi the work will be executed in brick on framework. Concrete floors will be la forced with B.R.C. fabric. The roof wi Mansard type facing Vauxhall Bridg covered with Westmorland slates, whilst will be a flat surface of concrete, with an a covering. The architect is Mr. Art Parsons, Abbey House, Victoria-street, whilst the contractors are Messrs. H. L. H & Sons, 16, Lewisham High-road, S.E. 1 steelwork will be supplied by Messrs. D Long & Co., Ltd., of Central Buildings,

Strand.—Quantities are ready for issue conversion of the old Villiers Cinema in street, Strand, W.C.2, into a Palais de winter gardens, &c. The plans show th tation of the existing building into a dan and winter garden, and the erection of a story building in the forecourt, facing street, to accommodate a restaurant, tion room, &c. Steel frame constructi brick filling and concrete floors will be a whilst a frontage of artificial stone will b duced. The dance hall will be cap holding 1,000 couples. The archite Messrs. Hatfield & Rowe, of 6, Marlb road, Richmond, Surrey. The quant veyor is Mr. A J. H. Sprague, 10 Holborn, W.C.2. The promoters of the are the London and Provincial Danc Ltd., Capel House, New Broad-street,

Greenwich.—Work will commence at date upon the extensions proposed to th General Hospital for South-East Lon Greenwich, S.E.10. A new block of thre providing 78 additional beds (three wa beds and six single-bed wards), ne kitchen, dining-room and classroom fo stores, &c., are to be built, together with section of a proposed nurses' home, stories, giving 78 bedrooms, to cost The buildings will be of brick with sto ings, and Mansard roof covered with A new lift will be installed in the wa and also new cooking plant. The tects are Messrs. Pite, Son & Fairwea Carteret-street, S.W.1, the quantity being Mr. A. J. Falkner, 12, Carter S.W.1.

Edgware.—Work is to proceed ne upon the erection of a row of the corner of Hale-lane and Edgwareb to the plans of F. Howkins, F.S.I., 1, parade, Golder's Green-road, N.W.1

t 16 shops, with frontages of Crow-ick, relieved by best red pressed rtland stone will also be used in the f the shop fronts. Each shop will h of 43 ft. and the frontages will vary 6 in. to 28 ft. The accommodation a sale space of 750 super feet, two two reception rooms, kitchen and l other domestic offices (on the first three bedrooms and w.c. on second floors will be of fireproof materials f will be of hand-made sand-faced centre shop facing down towards the " station will be occupied by the r Bank, Ltd., when the equipment up, designed by Messrs. Hall-Jones of Parliament Mansions, S.W.1, is

reet.—The site of 252–260, Regent- is now cleared of old buildings, and hortly begin on the large shopping h is to cover the area. With the cade as a central feature, the new have frontages on Regent-street, t, and Little Argyll-street. Sixteen e provided on these frontages, each ment below and a mezzanine floor upper floors will rise above the ned for letting purposes. On each arcade entrance—which will extend t-street to Argyll-street—will be a with a 30 ft. frontage, that on the g through to Argyll-street. Further ne the frontages to Argyll-street and ll-street. Three entrances—one in t, one in Argyll-street, and one in l-street—will serve the upper floors, an entrance hall and lift. A fourth installed inside the building. The e site will be left clear for lighting large glass dome being provided over on the ground floor. The total Regent-street is 100 ft., to Argyll- 150 ft., and to Little Argyll-street the total depth being about 150 ft. ons will be carried out in Portland construction will be on a steel frame- reproof materials. The roof will be type covered with Westmorland ns have been prepared by Mr. S. eves, 4, George-street, Hanover- . The quantities are by Mr. W. H. Furnival-street, E.C.4.

ND FOR ROAD WIDENING

r Simmons, K.B.E., Official Arbi- r the Acquisition of Land (Assess- mpensation) Act, 1919, has issued his laim by Mr. Edmond Warner against Aldermen and Councillors of Wool- rning the latter's acquisition of land side of and adjoining Footscray-road, mprising an area of about one- n acre, for the purpose of widening oad.

d is as follows: (1) The Acquiring to pay to the owner the sum of mpensation; (2) the claimant to s on this award; (3) all other costs by the respective parties.

earing of the claim, which recently at Woolwich Town Hall, Sir Arthur Town Clerk of Woolwich) appeared f the Acquiring Authority; while tanton (of Messrs. Murray, Hutchins itors, of Birchin-lane, E.C.), repre- claimant.

. Farrer, F.S.I., of Coleman-street, evidence on behalf of the claimant, d had a frontage of 170 ft. to Foots- nd a depth of 70 ft. His valuation o £552.

Sedgwick, F.S.I., district valuer for ch district, giving evidence for the uthority, valued the land at £170, at when the widening of the road ffected, Mr. Warner would be left y more than half the land. There- (Mr. Sedgwick's) opinion, the value taken would be £85.

RATES OF WAGES IN THE BUILDING TRADE.

Building Materials Bill Deputation.

The Minister of Health recently received a deputation from representatives of the manufacturers and suppliers of building materials. The deputation, while accepting the principle of legislation directed against persons seeking to exploit the necessities of the country, represented that some of the provisions of the Building Materials (Charges and Supply) Bill went beyond the pledges that had been publicly given by the Minister in the course of the negotiations prior to the Housing Bill. In particular they could not accept the clauses of the Bill providing for temporary taking over of works in certain circumstances. The Minister undertook that if they could put forward amendments which, without prejudice to the underlying principles, would meet their requirements, he would give them full and fair consideration.

PROPOSED NEW BUILDINGS & OTHER WO

IN these lists care is taken to ensure the accuracy of the information given, but i sionally happen that, owing to building owners taking the responsibility of comm before plans are finally approved by the local authorities, "proposed" works at publication have been actually commenced. w Hotel, Weston-super-Mare.

rand Central Hotel is to be erected Messrs. T. Macfarlane & Sons, Ltd. cheme will contain 150 rooms. The re Sir Henry Tanner & Sons.

hester College of Technology.

ing trades teachers from Lancashire re are at present considering at the College of Technology, recent ts in the building industry that eater efficiency of management and l craftsmanship. A report is to be e work done during the year by a ittee composed of members of the branch of the Institute of Builders lding trades teachers, and formed rence held in Manchester in October Mr. J. W. Riley, of Rochdale, will discussion on building examinations essity for national certificates. Mr. , of Manchester, will open with the n of training for higher positions ng industry, and Mr. F. W. Anderson, will deal with the introduction of s.

Tangent Door.

NEW INVENTIONS

Folding Doors.

A new system of folding doors has been put on the market by Messrs. P. C. Henderson, Ltd., of Tangent Works, Barking, E., and is known as the "Tangent Folding Door Gear." As will be seen by the illustration on this page, the gear only is supported, while the screen is made by a joiner. This design and many others are fully illustrated and described in Messrs. Henderson's publication, No. 24.

A New Curtain Runner.

A system of wheeled runners moving on a flexible metal rail for carrying curtains has been put on the market by Messrs. Wilson & Kingsley, Ltd., of 271, Goswell-road, E.C.1. It is claimed that with this device the life of curtains is considerably prolonged, as "dragging" when moving the curtains to and fro is eliminated. A rail is secured to the window frame, and to this rail the curtains are suspended from hooks attached to a wheel which runs along the rail. We are informed that each wheel attachment can support a weight of 112 lbs., and thus the heaviest curtains may be carried. The rail may be easily bent to follow the shape of any wall or window, and when fixed to windows one side may be made to overlap the other so that curtains are overlapped at the centre. We are informed that this curtain rail, called the "Rolo," has been installed in many public buildings and leading hotels throughout the country.

New Wolverhampton Factory.

Messrs. Courtaulds, Ltd., have decided to proceed with the erection of a factory at Wolverhampton in Hordern-road, adjoining the Dunstall Park Racecourse. The plans show that the complete factory will cover something like forty acres of land, and it is understood that operations are to be put in hand very shortly.

TRADE NEWS

A Canadian company who manufacture veneered doors, and also a large variety of stock white pine doors with solid sticking, are in a position to undertake regular export trade, and invite inquiries from British importers. Full information may be obtained from the Canadian Government Trade Commissioner's Office, Portland House, 73, Basinghall-street, London, E.C.2.

We have received from Messrs. D. & J. Tullis, Ltd., Clydebank, a copy of their latest pamphlet, illustrating and describing their "London Imperial" ironing machine. It is claimed this machine has completely revolutionised the laundry industry, and that not only is the output equal to, if not greater than, any other design of multiple machine on the market, but what is equally important, the finish on the linen has not been sacrificed. The makers state in designing their 1924 model they have aimed at keeping it as simple as possible. There is, it is stated, no return apron necessitating constant expert supervision; and that the mechanism has been so constructed that it cannot get out of order.

Messrs. Nicholls & Clarke, Ltd., of High-street, Shoreditch, E.1, having recently remodelled and decorated their showrooms, have now issued two catalogues of their goods. No. 20 gives a comprehensive list of general ironmongery and sanitary fittings, &c., fully priced, and illustrated, from which a selection of fitments may be made for any class of building whether commercial or domestic. It is a useful volume, and should be in every builder's office. Catalogue No. 21 gives coloured illustrations of leaded lights, some simple in character, others more elaborate in design. Sections of leads, casement handles, wrought steel casements, &c., are also illustrated fully and drawn to scale. The leaded light list is in colour, and gives an excellent idea of the high-class goods for which Messrs. Nicholls & Clarke are well known. It is not often nowadays that we get such complete catalogues of builders' materials, and the firm are to be congratulated on getting out such a comprehensive list.

A BRILLIANT LIGHT
OUT OF DOORS.
Contractors, Engineers and Surveyors will find the Tilley Lantern invaluable for use on Construction work, Waterworks, Sewage Farms, etc., and for all outdoor jobs which have to be done after dark. Absolutely wind and rain proof.
The TILLEY (Patent)
PARAFFIN VAPOUR LANTERN
Light of 300 c.p. for 6 hours for 1d.
Holds enough oil for 10 hours with once filling. The Lantern is strongly made in stout brass, and there are no parts which can rust, corrode, or get out of order. Easy to light, and will burn steadily anywhere, unaffected by weather, however severe. Get rid of acetylene flares and all antiquated devices and use this up-to-date and marvellously efficient storm lantern. Supplied complete with Oil Funnel, Mantle, Spare Vapouriser, and full instructions.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT

—No. 4263. OCTOBER 17, 1924.

THE VILLAGE

MANY of us have been enjoying a brief spell of leisure from work in the pleasures of the country-side, resting amid its quiet surroundings and the associations of the past. Whether in the Eastern Counties or the Cotswolds, we may still see life not so very different from what it was centuries ago. mp of the horses' feet, as they pass along the street in the morning twilight, and return at evenmind us of labour and habits stretching over a l years. Among the inhabitants are those who have een beyond the nearest town, and a few among the ve never travelled in a railway or been to London. ne of us who know little of the country-side would hem as uncouth and ignorant folk by the side of the in towns. The agricultural labourer of this kind is an n of the city, the reality far different. There is some- be learned from his life, often so much freer from of pleasure, not only on account of the distance from ut arising out of the varied interests and occupations is garden and his work include. Abounding in mother a first-hand capacity to do things, we find him less of a , and more intuitive and practical than his town brother, fe is compelled by a more narrow experience. At a hen so much is said about the restoration of village ought not to forget its many advantages. If the wage rably low and the problem of living at all a hard one, kind of labour, so near to nature, has exhilara- it, and it is not for this we need pity him. The nity sense prevails more in the village, and we too large to know about each other, if not always in ways. A corporate sense prevails in the country parish. ne such village out of many, wherein but one enamel ement disfigures the street, otherwise displaying only nt, homely time-worn characteristics, we speak, though f neglect lends some sadness to it now. The property assume belongs to a collegiate institution, and suffers ownership. For what interest in the preservation of its charm, its Tudor-built farms and cottages, does such ip bestow? The bursar—for there is no steward to er the property—will make a flying visit and hurry ain, and repairs are few and grudging, as the buildings We notice a hole in the roof of one of them, which has ere for weeks, and the cottage, one of the late Tudor nd inhabited, suffers no less harm than the unfortunate who dwell in it. It does not seem to the owners, who ld expect to be so conservative, a matter of any concern rve what is in their charge. We exaggerate, in our g ardour, the unsuitableness of these old cottages rn requirements. They have, nevertheless, bred stalwart thy types of countrymen in the past, and such further nces as are needed might well be added without new schemes becoming necessary, althou h they have been to fall into decay. Is not the traditional character of one-built cottages and farm buildings a contribution ell-being of life which we can all share? Yet we see adually but surely decaying, or with such repairs made as are almost as great an injury as decay itself. For pairs are made, the machine-made brick often replaces e of the old chimney. Care is not alway: taken to local characteristics or to depend on local material, t is the duty of the owners of such property to preserve is often not so much a question of the cost as the neglect about it at all. And the question of local material ery much the congruity of what is done. Who, having from the top of a certain lovely little town can egret the character of some new houses, which are word thrust into the beauty of the locality; or, e, where a new housing scheme has been carried lly incongruous to the surroundings, and defacing rance to the town. Tradition no longer aiding have to endure these things, so we see the hop "improving" itself with a plate glass window, ould disfigure a factory, quite unconscious of the vandalism in the act. These matters are conducted in a wholly haphazard way, without either direction or safeguards against the injury done. Greater efforts are now being made towards the conservation of ancient features, which will, in the end, do more to help village life than the imitation of town defacements which destroy its rural beauty.

It is a matter of wonder with some of us how the great churches came to be built which we may see in towns now hardly more than villages, so dwindled is the population. Their size and impressiveness a e accounted for in that the districts at the time when they were built were the centres of industry, such as those we may see in the Eastern counties. But this is only half the matter. The people liked to give the most glorious witness of their belief and the great buildings rose as the expression of it, not as an economic computation of seating capacity only, but from love of the beautiful, that which transcends any ephemeral profit and loss account. For when we have done all that our so-called genius for the practical can achieve, there still remains a vast unknown, and it is to this that we offer service when the artist in us directs our life. The evil is that we should have surrendered so much of this for economic and political considerations which hardly touch the heart at all. Life lived on such a plane may give us housing schemes and multiplied organisation, but will not restore beauty. For we live by faith, not sight, and all the best things come out of it.

Those great stone barns we pass on the roadside were not only to house corn, but to be the witness of the beliefs of men when life was more enclosed by religion. We labour this the more because it is this ideal which has gone out of life. An American Church Committee decided, as we read recently, to build a church over a grocery store which will be rented out for profit.

It is the very humbleness of village life which is a source of strength to it. We may find less facilities for listening-in, but more for the songs of the stars; and the owl's call from the dark elm trees may also contribute something. It is because of this nearness to nature that the village and contented villagers are so important; for within them the essential meanings of life are often better understood. We are not here setting up the village against the town—far from it—only the city has suffered more loss in traditional characteristics than the village. We rejoice, therefore, at the many agencies now directed to the revival of village life.

Now that the craftsman is carrying his work into the country-side and the small workshop is able to maintain itself, this influence should be very valuable, not only as the source of a limited amount of further employment, but in the impulse toward a better appreciation of country needs which lie in less dependence on the town. The artist also brings with him an outlook and appreciation which should react on the villager as he dwells among them and shares their life freer from class prejudices than others. Thus closer human relationships and a real aristocracy of wisdom and service may take the place of the foolish snobberies which too often divide the country-side, the inability to know each other being replaced by the desire for closer union. But the village is in danger, threatened in more ways than one. Work is becoming more uncertain in them, and the people will not stay. Though much better off on the same money in the country, when the weekly wage becomes uncertain they are safer in the town, where there are more chances of work. It is not true to-day that the countryman leaves his village because i is dull. He is compelled to do so in order to find work which the country no longer provides. We know of one village from which 40 to 50 of the inhabitants bicycle a long distance every day to their work in the towns in order to remain in their villages which they love. This desire is increasing and should secure all the aid possible. Pride of its own life is returning and to these efforts we should contribute all the help we can. To preserve village traditions and life is no dilettantism, but a necessity, for the village stands for a life the example of which is needed in the lure and dissipation of town life to-day.

NOTES.

A Great Building Scheme.

BUILDING activity of an important and conspicuous kind is about to commence from the designs of Sir Edwin Cooper for the Lloyd's Insurance and the Royal Mail Steamship Co., on the great areas which they have acquired bounded by Leadenhall-street and Lime-street. The designs for Lloyd's has been on view at the Royal Exchange last week and some admirable drawings convey an excellent idea of the finely planned scheme and its effective elevations. The principal entrance, in Leadenhall-street, is marked by a dignified and impressive composition. The long frontage to Lime-street will only be seen in quick perspective, and is treated with much simplicity. The lay-out of the plan has been dealt with by a master hand which suggests ease and convenience in the working of the various departments whilst giving many opportunities for free architectural rendering. Our readers will shortly have the opportunity of seeing in our pages how admirably Sir Edwin Cooper has dealt with this important problem of commercial building enterprise and we withhold any detailed explanations until the illustrations appear.

The National Federation of House Builders.

THE half-yearly conference of the National Federation of House Builders recently held at Leamington was of interest as showing what the more prominent members of the industry think of the possibilities of new methods of construction. The public—always interested in new things—is apt to place too much reliance on novel proposals which, however valuable they may be, are certainly not magicians' wands. The drab key to increased house building at a reasonable cost can only ultimately be found in increased output, both of materials and labour, and in sound organisation. The former can only be attained through a more exalted ideal and co-operation animating everybody concerned; while the knowledge of organisation, in so far as it affects actual building operations, is practically the exclusive property of the house builders. To look for success, without these essentials, in new methods or in increased density, or in simplified lay-out, is like lightening the load engine by cutting the driver's The difficulty is, of course, to d how to get the individual to wo utmost for the common good.

Adelaide House.

THE scale of Adelaide and the resultant d of Fishmongers' Ha other buildings may b pared to the effect of Bush House little church in the Strand. The critics who oppose the building i huge proportions because of the caused to earlier buildings of tectural and historical interest. Adelaide House is erected for n requirements of use that differ those of an earlier time and th requires a scale proportionate, a a logical reason for its enhanced p tions, and it appears to us that obj taken to it on account of the inj smaller buildings are difficult to s Is it also so certain that the s building suffers in the way sugge If, for the purpose of argument, Ad House were bad architecturally, it seem more likely to enhance the b of the smaller building. This seem us truer than to assume that a bea building is made less beautiful b erection of a much larger one nea The objection to the big modern bu should be on account of its ugline failure architecturally, for the m look of a building near an ancien is not the objection to it, but that a bad building. Stone facing which not really support the structure attempt to ornament a metho steel construction which does not out of any constructional necessit may criticise or approve of acc to our view of the function of tecture.

---

don ffic.

Another interesting address was that of Sir Lynden Macassey to the Institute of Transport dealith the urgency of centralised lanning for London. He suggested ust as there exists a Common Poor und, there should exist a Common Improvement Fund for the London area. Goods should be conveyed tunnels instead of on the surface, oviating one of the worst causes of congestion. Further points with we are in hearty agreement are the ility of giving a practical trial to duct method of eliminating blocks s-roads, the necessity for a road at Charing Cross, and the great that would accrue from an efficient of passenger boats on the Thames. England invariably display a lly timidity in approaching domesoblems of the first order, and n's traffic is hardly less important ne nation's fuel.

Coal.

Mr. Frank Hodges, M.P., in a recent address, emphasised afresh our criminal folly in burning raw coal. said, was the fuel of the future. In normal times we burnt 155,000,000 tons of raw coal yearly, thus wasting the by-products, obtaining only a miserable percentage of heat, and fouling the atmosphere. The speaker pointed out that one ton of coal could provide three gallons of motor spirit, 18 gallons of crude oils, of which at least 50 per cent. would be available for Diesel oil, and some two gallons for lubricating oil, 30 lbs. of ammonium sulphate (used for fertilisation), while 14 cwt. would remain over as a smokeless, free-burning fuel. The first Government that seriously tackles our national fuel resources will deserve our gratitude. Public opinion is ready for such legislation.

Road Facilities.

In different localities the country-side is suffering much defacement in order to provide greater security for the motor traffic, but it does not always appear that the remedies effect the results aimed at. We think of an example where some magnificent trees which sheltered the entrance to a very beautiful village were cut down in order to enlarge the view of the motorist. In this case, the benefit resulting proved very much smaller than the injury to the spot, and we think that more caution is necessary before such steps are taken. We were told by residents of the locality that it had not been of the benefit expected to motorists. These instances suggest that more care should be taken in such cases, for the injury to rural surroundings arising out of motor traffic is very serious and would appear to require the watchfulness of an organisation to protect the country districts in the same way as the S.P.A.B. seeks to protect our ancient buildings.

The Late T. E. Collcutt.

A long and honourable career has come to an end with the death of Mr. T. E. Collcutt, whose life has been of unquestionable benefit to the profession and many outside of it. We regret the loss of his genial personality. His direct influence on architectural design had already become a thing of the past, but his later years were marked by very earnest desires for the better housing of the poorer classes, and had another ten years of active work been vouchsafed to him we feel sure his efforts would have borne good fruit. He came into public notice largely through his Imperial Institute design and such works as the Wakefield Town Hall, but a great part of his time must have been devoted to hotel and other designs, in which he scored some notable successes. He collected clocks to an extent and in quality such as few can reach, and he understood furniture design to an exceptional degree. He had a strongly marked personality which won him many friends. Though his life was shadowed by such inevitable clouds as fall over all alike, we are glad to think that fortune smiled on an architect of such outstanding ability, and that much real enjoyment came to him in his declining years. The shortness of human life appears sadly emphasised when one considers the possible benefit to the world of an active force like Collcutt's if its powers at the age of seventy could last another twenty years. Every time a link with the past is broken, like the passing of a long known and highly esteemed architect, we cannot but feel how much our lives may hold of value to our fellows if we carry them forward under the influence of good tradition and honest endeavour.

GENERAL NEWS

Professional Announcements.

Mr. Robert C. Mathew, F.S.I., has removed to Bedford-row House, 58, Theobalds-road, W.C. 1. Tel.: Museum 7459.

Mr. Wilfrid L. Evershed, F.S.I., has opened a branch office at 3, High-street, Woking.

Annfield Plain.

The design of Messrs. A. & F. Manuelle, Ltd., London, has been accepted for the Annfield Plain War Memorial.

Royal Institute of British Architects.

R.I.B.A. Intermediate Examination, November: The centres for this Examination will be London and Leeds. At both centres the examination will be held on November 21, 24 and 25.

At the London centre the oral examination will be held on November 27, and at the Leeds centre on November 26.

South Wales Architects.

Major Harry Barnes, F.R.I.B.A. (Vice-President of the Royal Institute of British Architects), delivered a lecture to the South Wales Institute of Architects and the Institute of Builders, at the Engineers' Institute, Cardiff, recently, on "The Architect, the Builder, and the Client."

Mr. Percy Thomas (President of the South Wales Institute of Architects) occupied the chair, and supporting him were Mr. J. Turner, J.P.; Mr. Charles Thomas (Swansea); and Mr. H. Teather and Mr. Alwyn Lloyd, of the Welsh Town-Planning Association.

Major Barnes, in the course of his remarks, expressed the hope that the client would learn to perceive more clearly the distinction between the engineer and the architect, and the fact that, except in rare cases, the one could not be employed to do the work of the othe were distinct professions.

He appealed to the builder as the of the doors" through which the crafts and materials which were essential ele the building art must pass, to co-op the revival of craftsmanship and the pr of materials, which should possess not qualities required to resist the eleme stresses they had to meet, but also the of texture and colour. He expressed th conviction that much of the divisio unfortunately existed at the present day builder and operative would disapp the revival of a common interest in a craft.

COMPETITION NE

Barton-upon-Irwell Union.

The assessor, Mr. W. A. Pite, F.R.I.B made the following awards in this comp (1) Messrs. Elcock & Sutcliffe, 21, North land-avenue, London; (2) Messrs. Adam den, Hyde Park Corner, London, (3) Messrs. H. V. Ashley & W. Newm Gray's Inn-square, London, W.C.; E. B. Bailey, 9, Cook-street, Liverpool

Harrogate Infirmary.

The assessor, Mr. S. D. Kitson, has m following awards in this competitio Messrs. Elcock & Sutcliffe, 21, Northumb avenue, W.C.2; (2) Messrs. Lanchester, & Lodge, 19, Great Russell-street, (3) Professor Beresford Pite and Mr. J Hodges, 101, Great Russell-street, W.C.2

Dundee School Competition.

Mr. John Arthur, the assessor, has m following awards in the competition for for the new advanced school in Blackne for the Dundee Education Autho (1) Messrs. Maclaren, Soutar & Salmond, J. O. Allan, Aberdeen, (3) Messrs. A Friskin, Dundee.

Monument to Sir Wilfred Laurier.

The full result of this competition follows: (1) Mr. J. Emile Brunet, Par Mr. Antonio Sciortino, Italy.

Valletta Lay-out Competition.

Designs are invited for the lay-out open spaces and fortifications between and Floriana and those encircling F Applications for particulars, with a de £5, to be made to the Minister of Public Public Works Office, Valletta, Malta, n than December 1. Premiums of £1,000 a are offered to the first and second com respectively. An indemnity of £100 awarded to three other designs showi spicuous merit. The assessors are Mr Warren, F.S.A., and Professor Patrick crombie, A.R.I.B.A. Sending-in day, J 1925. Conditions can be seen at this

Holbrook School.

Sir Aston Webb, P.R.A., has been ap by the Royal Hospital Schools, Gr assessor of the designs for the new buil be erected at Holbrook, Suffolk. Six ar have been selected to prepare plans, a will be placed before the assessor on ber 1.

Other Competitions.

Other competitions still open incl following (the dates given are, first the se date, and second the issue of *The Bu* which full particulars were given):— Hall (May 1). Manchester Art Gallery (Aug. 22). Concrete Cottages (Oct. 31; S Christian Science Church, Southport (no in date announced; Sept. 26). Bar Memorial Club (no sending-in date ann Sept. 26).

ORRESPONDENCE

Peace in the Industry.

—Your editorial, "Peace in the Indus- has evidently aroused very considerable t, from which it is clear that the matter ch in the mind of the public, waiting or some such lead as yours to give it ventilation. In doing this you are to the good work which you have so isly undertaken on behalf of the best ts of the industry.

nust be clear to everyone that the pre- ituation is not a satisfactory one. No on which has as its object a peaceful ettled condition, but which is liable at nes to disruption, can be described as ctory. However, that there has been s will not be denied. To any student history of the building trade it will be hat from the year 1799 to the present here has been very considerable change. ne 17, 1799, the first Act forbidding all ations was rushed through the Com- and Lords in three weeks. This law d for the sentencing to three months l or two months' hard labour of any g men who combined to gain an in- of wages or decrease in hours. The item of dispute at present is merely -hour. Consequently it is clear that nough conditions may not be described led, something has been achieved; and nething is the recognition of the claims operative.

s Major Harry Barnes says in your or October 10, peace in the industry is vaited for until the Royal Institute of Architects receives intimation from arties that they would favourably con- he establishment of a permanent tri- for the settlement of disputes in the g industry, then peace will be long de- For whilst it is unlikely that such an ill come from the operatives, it is as as anything can be that it will never hcoming from the employers. With respect for your correspondent and all ties concerned, it is desirable that it be realised that if anything but wait- something to happen is ever to be n offer should be made by a party of rchitects to a party of operatives, as a ep. The history of the industry, as by Mr. R. W. Postgate, gives proof e operatives have always led; and such ination would go far to force the third o come in or to stay out. Recourse to again proves that the latter event be unlikely.

J. E. Yerbury states that there is very oubt that both sides are badly led, in- as the leaders of both sides are in o be Napoleons rather than Solomons. be said without disparagement of any parties that their viewpoint becomes on rising to power, but at the same is not to be doubted that the rank of all parties are amicably disposed, a high regard for each other, and de- ve all things the peaceful conduct of dustry. Can it be that whilst this s so universally shared amongst the d file the peaceful condition desired waited for until the Royal Institute sh Architects receive a clear invita- n both parties that they would favour- nsider the establishment of a perman- unal for the settlement of disputes in ding industry? Once again reference Postgate's "Builders' History" will at progress has not waited on such an The amelioration of conditions in the industry has progressed without any having been made to the Royal In- f British Architects, and has resulted ne recognition of the efforts of the s towards that end by the more fair- masters, and the architects who have o be approached by these two parties waiting, and will wait for ever.

Any person or body of persons that continually stands aloof becomes in time to be regarded as one which does not matter; and it will be no overstatement of the case to say that, if the operatives and employers were asked, this would be their feeling as to the value of the opinion of the architects on the conditions of the industry. This being so, is it likely that an offer will come from either of these two parties that the architects should intervene? The only hope of any progress, as has been stated above, and cannot be too often repeated, is for the offer to come from the party which has so far stood aloof, but which is so eminently suited to act in arbitration within the industry.

If, by your further efforts, you can gain the acceptance of this idea, you will be acclaimed by every fair-thinking man within the industry.

A CORRESPONDENT.

London.

Housing and Rent Acts.

SIR,—Owing to pressure of work I was unable to read your issue of September 26 last until recently, and therefore have not been able to reply to the comments in your leader on housing.

With regard to the statement made by me on June 6 last, that working class dwellings never had been supplied by private enterprise, I only wish to point out that I did not state that *no* working-class dwellings had been provided, but that the working-classes as a whole have not been supplied with new houses by private enterprise. The vast majority of the working-classes live in houses which were built for the richer classes, and have been discarded by them, and comparatively few have had new houses provided by speculating builders.

Regarding your reference that you do not follow my argument against the immediate repeal of the Rent Acts; having referred to my letter, I see that it is not as clear in statement as it might have been, but what was in my mind when writing was directed more against your reason for advocating the repeal, viz., "that the cost would then be borne, not by the community as a whole, but by those who were supplied with what they wanted," with which I do not agree. In so far as the want of individuals is caused by the act of the community I think it is the duty of the community to supply that want.

I still think that the immediate repeal of the Act would greatly prejudice the professional middle classes, and in effect penalise the ex-Service men (who have not been able to obtain houses), while leaving his stay-at-home neighbours untouched (because they have entered into definite agreements limiting their rent for a period of years). I do not think repeal will greatly affect the provision of working-class dwellings, which, at the lowest rentals, are at the present time beyond the means of the poorer paid worker.

I do agree that subsidies are wrong, and have shown a better way of providing houses in your issue of July 18 last. I would not repeal the Rent Acts immediately, and am afraid of your suggestion to assist the necessitous tenants, because I fear it might develop into another system of doles, which would be open to abuse by the unworthy and certainly would not be taken advantage of by the very people who are of the greatest value to the State.

JOHN E. YERBURY.

Old English Villages and Modern Town Planning.

SIR,—It has often occurred to the writer that there is room for a book describing in detail selected examples of typical old English villages, the work being designed principally for the use of architects, town planners, landscape gardeners and artists.

Although nearly all these old villages grew in very haphazard fashion and with but little relation to definite plan, they furnish, nevertheless, suggestions of direct and practical utility for all who are engaged on schemes for new garden suburbs, villages, and town plans, and are at the same time endeavouring to recapture for modern purposes some of the charm that dwells in the old places.

It seems that what is needed is a compilation in book form containing the ground plan, ground contours, roads, buildings, gardens, streams, and general lay-out, of between a dozen and a score of the finest extant examples of unspoilt old villages.

The exteriors of churches, houses, and other buildings, &c., could be illustrated by photographs, and the same method can be employed to show other important features such as unique gardens, plantations, bridges, and picturesque spots.

It is true, of course, that the ground plan of any village is to be found in some detail on the large-scale maps of the Ordnance Survey, and hence the primary data needed is already available for anyone proposing to write a book of this kind. But a compilation on the lines sketched out above will involve a great deal of additional labour, for most of the information required has not, it would seem, been published, or, if published, is not in an easily accessible form.

This book would make an appeal not only to those mentioned above, but also to a large and various body of general readers.

T. W. MACALPINE.

Gravestone Art.

SIR,—I see from a recent issue of one of the London dailies that a committee has been formed to inquire into the possibility of raising the standard of gravestone memorial art. The decadence in this as in other branches of the applied arts is due to the commercialism of the age. As students, the majority of qualified architects have studied this branch of design as part of their training. To-day an architect is rarely called upon to design private memorials of such importance as the Bridport tomb at Salisbury, the Burleigh tomb at Stamford, the de Grey tomb at York, or the Percy Shrine at Beverley, but now the village mason has for the most part ceased to design in the local traditional manner it is well to point out to the general public that by going to a qualified architect they will get more value for their money than by going to those firms who do not keep designers who can put the individual and personal touch into such work, but turn out endless copies of stock types with various embellishments to suit the varying costs. The mediæval village mason usually knew the life story of the person to whom the memorial was to be erected and the heraldic history of his family; his design was, therefore, a thing of meaning and sense.

Few designers would be retained by their firms if they took time to inquire into the personal history of the deceased, but by no other means can that finality of design be obtained which places any new work into its place in the traditional line of its class. A walk round any old churchyard would convince any but the most prejudiced that no matter how simple such work may be the unity and beauty are largely, if not entirely, due to its personal application of the individual's life story to the design, together with a conscious or unconscious appreciation in the designer for beauty of form, scale, and detail.

Whether any architect sits on this committee or not I do not know, but it is difficult to see what good such a committee of investigation can do. The public do not yet seem to have grasped the fact that there are many qualified architects who are mainly architects because the creating of beautiful things is to them the one means of self-expression, and that they are wholly devoted to the interests of the smallest client. The proper collaboration between the architect and sculptor would lead to a revival in this most interesting and fascinating branch of art. War memorials have failed, as a whole, for the want of this collaboration.

Edinburgh. WILLIAM DAVIDSON.

THE ARCHITECTURAL ASSOCIATION EXCURSION TO SPAIN—II

By A MEMBER OF THE PARTY.

September 18.—Segovia proved to be very rich in doorways and small façades, a favourite motif being a rather squat arch of enormous voussoirs surmounted by balconied window. The interior of the Cathedral is noble in its scale and comparatively simple, and here, as in all Spanish churches, the wrought iron work is so plentiful and magnificent as to defy description. We discovered that a worker in majolica had established himself in a Romanesque church on the edge of the town of which he had converted the clerestory into a flat, using the remainder of the building as work and show rooms. The Alcazar, like Melrose Abbey, should be seen by moonlight when the iron hand of the restorer is less in evidence. Of the many things we saw at Segovia none were more interesting than the suppressed monastery known as El Parral, whose church, now bare of all contents except a magnificent retable, has a serenity and beauty of proportion that are extraordinarily fine. Like most Spanish churches, El Parral has no east windows and the lighting of the altar by means of windows high up in the transepts is very effective. Perhaps it was because of the absence of over-ornamentation that disfigures so many Spanish churches, that we enjoyed so much the beautiful lines of this one. No place in Spain, I think, has left us with more pleasant memories than Segovia.

September 19.—This, our last day in Madrid, was devoted to the Escorial by all except some half dozen members of the party who were summoned to meet King Alfonso. Situated among the mountains about seventeen miles from Madrid, this immense building contains a palace, a monastery, a convent, and a church, the burial-place of the Spanish Kings since Philip II. This monarch imposed his austere personality on his architects, Juan Bautista de Toledo and Juan de Herrera, and the whole structure wears an air of gloomy magnificence that well expresses its founder. Its scale is immense, and its simplicity unusual in Spain. Some of the courtyards are attractive, and the views from the windows are magnificent, but one thinks of it chiefly in its strength rising from and almost forming part of the rocks on which it stands. A little pavilion built in the gardens in 1772 two centuries later makes an attempt at gaiety which is curiously pathetic, so completely is it dominated by the sternness of El Escorial. Our night journey to Cordoba was animated by accounts of the King's amiability to his visitors and his horror and surprise at learning of the rise of a race of lady architects in England.

September 20.—A somewhat depressed party descended at Cordoba at dawn, but great solace was at hand in the club of which we were made members for the day. In its sunny patio we became our better selves, and soon set off to see the famous mosque, the largest in Europe, and the centre of Mohammedanism in the West during the Moorish conquest. A Christian church has been built in the centre of the mosque, and its unexpected appearance amidst the long lines of columns and horseshoe arches is more strange than satisfactory. Some sham vaulting is now being taken down here, revealing the much more interesting and characteristic Moorish wooden ceilings. The most charming place in Cordoba was a private house which we were privileged to enter—that of Don Gomez, now the property of the Marquis of Viana. Its patios, and its walled garden overlooking the street, all richly clad in plumbago and jasmine, bright with cannas and shady with orange trees, were a relief from the prevailing ecclesiasticism. Charming rooms, with some exceedingly good furniture and decoration, overlooked these courts, and some of us felt that we could have happily spent the day there. The stronghold of the sombrero-making industry is Cordoba, and some of our party supplied themselves with authentic hats. The city itself with its narrow winding streets wears something of the aspect of Toledo, but there are signs of considerable building activity. That evening we reached Seville, our final objective, and settled down in a hotel in a square cynically called "Del Pacifico" on account of the nerve-shattering noises which emanated from it.

September 21.—Seville was enjoying a heat wave, and the most hardened sun-worshippers were glad to keep to the shady sides of the streets. Our first visit was to the famous Giralda Tower, from whose summit the city could be seen spread out. The tower itself is Moorish with the exception of the superstructure, which was built in 1568, but so admirably is it composed that the whole structure appears to be the inspiration of a single mind. The cathedral itself is immense, approaching St. Peter's in Rome in size, although the simplicity and unity of the design prevent an immediate realisation of its vastness. As usual, the coro and high altar are enclosed and face each other across the transept screened by the most magnificent gilded iron grilles. Much of the stained glass, although not of what is generally considered the best period, is superb in colour, and the whole structure is impressive in the highest degree. The Alcazar, the remains of the Moorish citadel, was our next objective. Its exterior still preserves the appearance of a mediæval castle, but within the delicate and intricate ornamentation of a later date clearly indicates a palace built for pleasure. A good deal of restoration has taken place which, although it has recaptured something of the original gaiety of colour, has also lessened the attractiveness of much of the work. The patio of the Maidens, nevertheless, has a delicate beauty of its own, and some of the tile work is admirable, while the gardens laid out by Charles V in the sixteenth century form the most delightful retreat. Their palms and orange trees, overhanging the richly adorned fountains and pools, gave to those of us who had never visited the East some idea of its exotic beauty.

Seville as a city is bounded on the east by the Alcazar with its gardens, and beyond these lie pleasure grounds. Permanent exhibition buildings have been constructed, and are in course of construction here for a Pan-Spanish exhibition which is to take place in 1927. The lay-out is an attractive and interesting one, and the buildings themselves are designed in a manner reminiscent of Seville's native architecture.

September 22-24.—The official programme of the excursion finished at Seville, and since several days were passed there I need no longer adhere to diary form, but shall content myself with a general description of some of the places visited. The city is unusually rich in Renaissance buildings, both civil and ecclesiastical, and among the latter one finds in its fullest development the richly ornamented Spanish Baroque. Close to our hotel there stands one of the most interesting of these, the church of San Pablo, formerly the convent of Sta Magdalena. This church had been restored by Sig. Gutiérrez—restored only in the sense that he had exposed some very interesting work of Moorish character, particularly a vault in Micah form. The unfinished west front is magnificent in scale and decoration, and, in spite of its over-ornamentation, the interior is full of suggestion. For the work of an earlier period the convent of Sta Paula may stand. Its gothic entrance porch in fine red brick with majolica decoration is one of the most delightful things we saw. On the south bank of the river are two interesting churches, Sta. Ana San Jacinto, both in richly decorated R sance. The archbishop's palace adjoinin cathedral has a pleasant seventeenth ce baroque façade and a fine patio, whil most imposing example of the plater style is to be found in the Ayuntan (city hall) which overlooks the cha palm-shaded central square. Scarce square foot of its surface but has been c yet the general effect is not lacking in br

The city museum is lodged in an old vent and contains a large collection of ings as well as archæological speci Here Murillo leads, and there are som mirable pictures by Zurbaran, but for g interest the museum cannot compare wit of the Prado. I have left to the last th fine private houses which we visited Casa Pilatos and the Casa of the Du Alba. The first-mentioned is in some re more attractive in its detail, but the la a very fine example of the private res of a Spanish nobleman. Its patio and g resemble those described in the house o Gomez at Cordoba, but they are on a gr scale, and some of the apartments are and finely proportioned, and peculiarly esting by reason of their coloured and rated wooden ceilings and their pain The last-mentioned are of considerable torical interest to Englishmen since the D of Alba hold also the title of Duke of Ber

In Seville, as in Madrid, the entire en of the party were not consumed in s seeing, and many of us found opportuniti hear and see something of the tradi Andalusian singing and dancing. A good of this takes place in the open air, an one occason we found ourselves on the of a small pavilion, the music being sup by a "hurdy gurdy" specially dedicat our use. Our last evening provided a su opportunity for drinking the health of Gutiérrez, and for thanking him for the ordinary kindness which he had shown t party since its arrival in Spain. He completely thrown aside his work, had with us throughout our tour, and had played endless patience and high s Without him and the other Spanish arch who so kindly accompanied us, Sigs. P rutza, Arcas and Arnal, we could not seen or learned what we did, and w them all a great debt of gratitude. T Yerbury also acknowledgment was ma his most successful efforts in arrangin 1924 excursion. It was to his gift for o sation that we owed our most successfu to Spain, and every member felt they had part in the most interesting excursio A.A. has held.

Students' Work at the R.I.B.A.

The large collection of students' dr now on view at the Institute afford a favo view of the scholastic activities in archit education. The many schools repre may claim to be doing valuable work preparation for an architect's career. Th of the drawings represent the five years' of students at various schools, which has for them exemption from the final exami of the Institute; whilst some three t hundred count as the work of a three course, which earns exemption from the mediate examination. This exhibition a thousand drawings is well worth seein contains a good deal of encouragement f future, but it is difficult to see what may h if the present rate of progress is main for the pressure on space at the Instit already nearly at breaking point. Perha cause for satisfaction that little or noth the way of eccentricity marks the d As this is, we believe, the first time th London University has put in an appe at these exhibitions, it is of interest to c their work with that of other schools have been earlier in the field, such a A.A. and Liverpool University.

COMPETITION FOR PROPOSED HOSPITAL AT DAVYHULME, NEAR MANCHESTER

AN excellent site of some thirty acres has been secured at Davyhulme, for the Burton-upon-Irwell Union, and the conditions of the competition for the new Hospital were drawn up by Mr. William A. Pite, F.R.I.B.A. From an examination of these, this appears to us to be the first instance of a distinct effort being made on a large scale to develop the Poor Law Hospital on more efficient and modern lines, in conformity with present general hospital requirements. The consistent demands which have been generally made by guardians throughout the country for improved conditions, seem at last to be bearing fruit, and have secured acknowledgment from the responsible Government authorities who have now under consideration a draft memorandum setting forth the requirements for such buildings, based upon higher standards than hitherto accepted for such buildings.

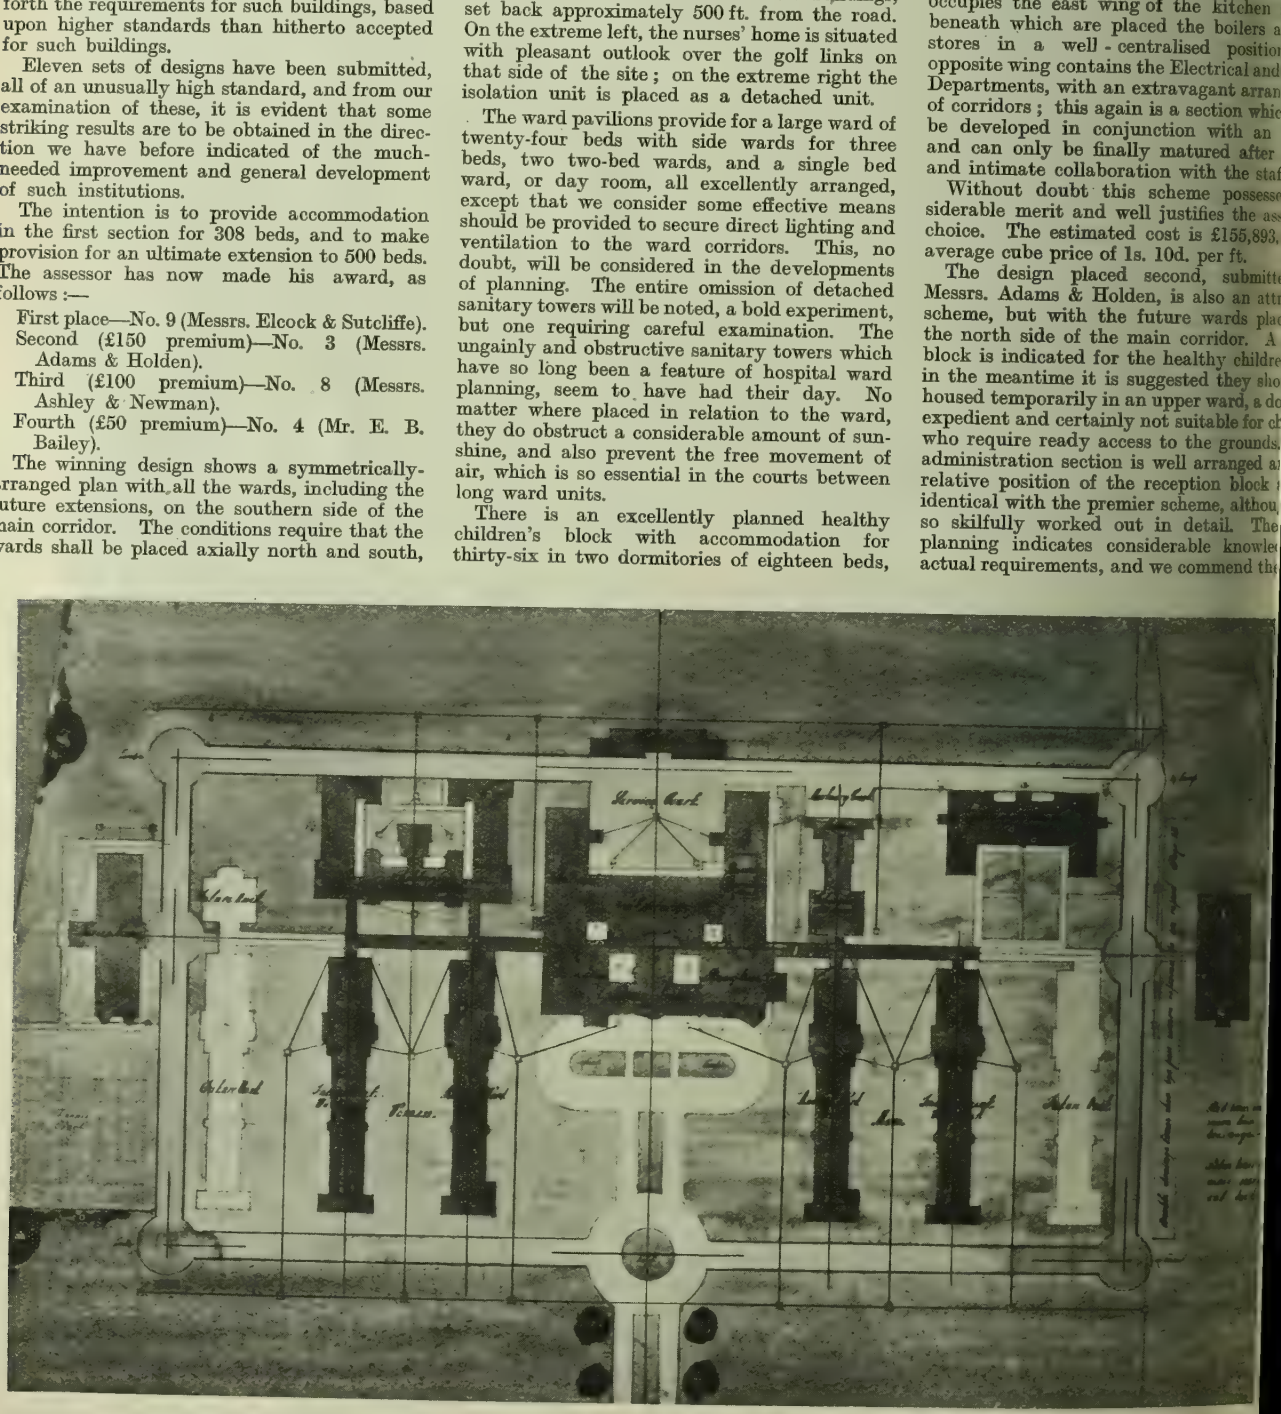
Eleven sets of designs have been submitted, all of an unusually high standard, and from our examination of these, it is evident that some striking results are to be obtained in the direction we have before indicated of the much-needed improvement and general development of such institutions.

The intention is to provide accommodation in the first section for 308 beds, and to make provision for an ultimate extension to 500 beds. The assessor has now made his award, as follows :—

First place—No. 9 (Messrs. Elcock & Sutcliffe).
Second (£150 premium)—No. 3 (Messrs. Adams & Holden).
Third (£100 premium)—No. 8 (Messrs. Ashley & Newman).
Fourth (£50 premium)—No. 4 (Mr. E. B. Bailey).

The winning design shows a symmetrically-arranged plan with all the wards, including the future extensions, on the southern side of the main corridor. The conditions require that the wards shall be placed axially north and south, an axiom of hospital planning; but we note that several competitors penalise their future wards by planning them on the northern side, where conditions cannot possibly be so good. With site unrestricted and an abundance of space available, there is no excuse for any arrangement but the best, where the maximum of value of site, sunshine and outlook can be secured for the patients. These advantages are embodied in the winning scheme, which is a most compact and economical plan, well illustrated by a delightful set of drawings illustrating an architectural treatment of considerable merit and thoroughly well considered in details of plan. The principal entrance is from Moorside-road, and the wards are arranged on each side of the central administration buildings, set back approximately 500 ft. from the road. On the extreme left, the nurses' home is situated with pleasant outlook over the golf links on that side of the site; on the extreme right the isolation unit is placed as a detached unit.

The ward pavilions provide for a large ward of twenty-four beds with side wards for three beds, two two-bed wards, and a single bed ward, or day room, all excellently arranged, except that we consider some effective means should be provided to secure direct lighting and ventilation to the ward corridors. This, no doubt, will be considered in the developments of planning. The entire omission of detached sanitary towers will be noted, a bold experiment, but one requiring careful examination. The ungainly and obstructive sanitary towers which have so long been a feature of hospital ward planning, seem to have had their day. No matter where placed in relation to the ward, they do obstruct a considerable amount of sunshine, and also prevent the free movement of air, which is so essential in the courts between long ward units.



There is an excellently planned healthy children's block with accommodation for thirty-six in two dormitories of eighteen beds, each with well disposed bathrooms a tories, a central duty-room and adequ rooms and verandas. Dressing roon necessary adjunct to the bath-rooms, that the children may avoid the steamy phere of a bathroom when changing ni morning.

The maternity and sick children's a well-planned section, but the central co wing would have been better placed opposite end of the sixteen-bed wa opening out for sunshine from the soutl a position further removed from any obstruction caused by the main corrid

To the right of the administration s well-detailed reception department is with convenient access to the hospi egress to the isolation unit when require kitchen department, with stores, &c., factorily arranged with a good service c the north side, on the opposite side o are placed the various workshops. The occupies the east wing of the kitchen beneath which are placed the boilers a stores in a well-centralised positio opposite wing contains the Electrical and Departments, with an extravagant arran of corridors; this again is a section whic be developed in conjunction with an and can only be finally matured after and intimate collaboration with the staf

Without doubt this scheme possesse siderable merit and well justifies the ass choice. The estimated cost is £155,893, average cube price of 1s. 10d. per ft.

The design placed second, submitte Messrs. Adams & Holden, is also an attr scheme, but with the future wards pla the north side of the main corridor. A block is indicated for the healthy childre in the meantime it is suggested they sho housed temporarily in an upper ward, a do expedient and certainly not suitable for ch who require ready access to the grounds. administration section is well arranged a relative position of the reception block identical with the premier scheme, althou so skilfully worked out in detail. The planning indicates considerable knowle actual requirements, and we commend th

tal cube of this scheme is given as
ft., and is priced at varying rates
our opinion, are far too low. The
ated to be £134,845, but we consider
somewhat under-estimated.

Of the other designs submitted in the competition we should like to mention the excellent and attractive project of Mr. Arthur Kenyon, an architectural composition which stands a long way ahead of the remaining sets. The drawings are delightful and illustrate a simple but very effective grouping of buildings. We are afraid, however, that Mr. Kenyon has risked much in order to produce a distinctive plan. The wards, which are set diagonally on the site, are, strictly speaking, a contravention of the conditions. The wards are in detail very satisfactory, and throughout the standard is the usual high one associated with Mr. Kenyon's work. The Report states that the fan-shaped plan was adopted in order to avoid undue crowding of the wards, but the other schemes rather go to disprove such a suggestion. The high roofs shown are very delightful but expensive, and the total cube given is a high one—2,145,583 ft. The total cost is estimated at £215,378, cubed at 1s. 10d. per foot. The provision for children's sick wards and healthy children's accommodation is not altogether satisfactory.

Messrs. Rees & Holt (No. 7) submit a satisfactory plan, well balanced around central administration and stores, &c. An excellent ward plan is a feature of this scheme and to be commended.

The scheme submitted by Messrs. Gibson & Gordon (No. 5) is on orthodox lines, with wards which in the administration end are of an unusual type. The stores appear to be curtailed in area and also the office accommodation. An excellent theatre plan is submitted.

Messrs. Paine & Hobday (No. 1) also show a scheme of the usual type, the whole very clearly illustrated. A few scattered buildings are dotted about in the foreground, comprising the healthy children's block, the mortuary, isolation block and the nurses' home near Moorside-road. The sick children are somewhat isolated for efficient control and administration. The elevations are of an austere and forbidding type, of an institutional character of the wrong type.

Scheme No. 11, by Messrs. Saxon Snell & Phillips, shows a central administration, but otherwise a scattered group of buildings, priced at 1s. 4¾d. a cubic foot!

Mr. Milburn's plan (No. 6) is a most orderly one of correct and orthodox type. The plan submitted by Mr. T. A. Pole (No. 10) is decentralised and scattered, with the reception block and the administration section disposed on the west side of the site. The boiler-house is detached, with long subway connection of approximately 480 in length. The T-shaped ward units are certainly interesting and show many points of value. The cost is high—£210,000—and priced at figures of 1s. 9d. per cubic foot and less.

The guardians have, we understand, unanimously accepted Mr. Pite's award.

Messrs. Elcock & Sutcliffe, in the course of their report accompanying the winning designs, state they paid careful attention to the grouping of the various departments for easy and rapid administration and to enable visitors to gain quick access to the wards with a minimum of traffic through other departments.

Economy in capital cost and annual upkeep was also a main consideration.

The accommodation for the Healthy Children's Unit is provided to the north of the main corridor and two dormitories have been shown, one for the very young children and the other for those who are older, chiefly to avoid disturbance during sleeping hours. A large day room faces due south with folding screens to divide the veranda from same, so that in suitable weather the whole may be thrown open to the air. The kitchen and other necessary appointments are provided centrally, while the office for the sister-in-charge is right in the centre, on the veranda side, thus permitting of complete supervision.

The Maternity Units have been carefully designed to incorporate the latest ideas in this special department. The pre-natal ward, on the south side, is entered immediately from the main corridor; the two maternity wards are at the east and west sides and designed to admit sunlight and air on all sides. The labour wards are placed in the most private and isolated position, while the large duty kitchens and the other necessary surrounding offices are centrally situated, with the ward sister in immediate control of the whole unit.

The Nurses' Home is situated on the western portion of the site with a pleasant outlook, and is entirely self-contained with kitchen and stores, supplied by the central stores in the main kitchen department of the hospital. It is suggested that a considerable portion of the cooking for the nurses' home might be carried through in the main kitchen, leaving a minimum of cooking to be done in the home. The home sister's office is placed on the ground floor overlooking the main entrance, and a suite is provided for the matron. The equipment also includes a nurses' recreation room, sitting room for the sisters, lecture room, reading and writing room with a study, which is placed at the northern end and away from the general traffic of the home. The dining room, with suitable service room, is shown to seat 40 people comfortably. The bedrooms, for sisters and nurses, are placed on the first and second floors, with ample bath rooms, linen rooms, and box accommodation, and a box lift connects the various floors.

The walls generally would be built of brickwork faced with a plum-coloured brick with wide white joints, the dressings of artificial or "reconstructed" stone. All floors would be of fire-resisting materials with the beams crossing the wards formed in the thickness of the floors so as to give a flush ceiling. The finish to inside of walls throughout would be of hard plaster well worked, and in the wards bands of coloured tiles inset.

In the children's wards and the Healthy Children's home, pictorial tile panels would be inserted, flush with the plasterwork to brighten the units with homely and interesting subject pictures. All flat roofs would be of concrete with a non-conducting layer of fine broken brick on top, then cement screeding and asphalte cover.

THE GENIUS OF THE ENGLISH CATHEDRAL

Sir Banister Fletcher recently delivered a lecture on the origin and design of the cathedral, which, he said, was gradually evolved from earlier building types through successive periods and was enlarged and enriched as the ritual needs and devotional spirit grew.

The plan might hail from several sources in remote pagan days. Sometimes an ancient temple was adapted, the chancel being fitted up at one end, the side columns being destroyed or walled up as occasion served. Many believed that the Roman basilica, or law court and exchange, served as a model for its plan, with colonnaded aisles and semicircular "apse" at the end, it closely resembling the earliest basilican churches. Some, again, believed that the small "scholae" for discussions among the learned, as at Pompeii, or the atria of Roman villas with their transeptal wings, were adapted to the purposes of worship when these earlier types were discarded as places of meeting and the Christians could build edifices for themselves. At all events, such early Christian "basilican churches" were the first stage of a continually changing process of plan development which could be traced in the Romanesque plans of St. Gall and the early churches of Western Europe, and culminated in the great structures erected in the mediæval period and now regarded as triumphs of English architecture—their cathedrals.

Sir Banister gave a synoptical description of the chief features of the cathedrals of Western Europe, more especially of France—where the transepts were short and the east ends encircled with chapels to form a "chevet"—and of England, where double transepts, as at Salisbury, were peculiar features, aisles were usually single on each side of the nave, and green "closes" formed the rustic setting.

The next lecture will deal with Gothic constructive principles.

THE LATE THOS. EDWARD COLLCUTT

BY PROFESSOR BERESFORD PITE

THE death of Thomas Edward Collcutt occurred on the 6th inst. He was born at Oxford, March 16, 1840, educated at Cowley and at Mill Hill, articled to R. W. Armstrong, of London, and became assistant to G. E. Street, R.A.

Architects now mourn a vigorous and gifted leader whose powers endured to the end of his long life. His cheerful company and frank expressions of opinion are lost to a large circle of friends—a circle which extended both beyond the Institute and that select group of kindred spirits who solemnly entitle themselves The Foreign Architectural Book Society.

Collcutt's advent came in the later era of the great men of the Gothic Revival. Norman Shaw, who had been in Street's office before him, the two Seddings, also there, Waterhouse, William Burges, Ernest George, and Edward W. Godwin were all at their best, filling the architectural world, fed by the weekly journals, with interest and enthusiasm.

There would scarcely seem to have been room for a new leader, but the atmosphere was electric. Our dull outlook at the present day, with its gloomy academicalism, can hardly realise the delight of Collcutt's powerfully original Gothic design for the Wakefield Town Hall, selected by Street, drawn in perspective by F. G. Knight, another product of that office; a delight clouded over by a threatened alteraton to Renaissance, but rekindled with perhaps the freshest interpretation that can be imagined in freedom of treatment. The building justified the architect and made his reputation. In Bloomsbury-square at the same time the conventions of the district were rudely disturbed by the erection of No. 36 in red brick with a steeply-pointed gable and tiled roof; everyone could well believe that it must have been built by the architect for himself.

The Queen Anne movement of the School of Norman Shaw and the popular Low Country picturesqueness of Ernest George's work in London can with advantage to the student be compared with Collcutt's buildings. The antiquarian spirit which in the eyes of a Continental architect infects our work with a dead vaccine is absent in Collcutt's designs. He cannot be claimed as an archæological architect by any school. His outlook resembled Waterhouse's in grasping the qualities common to successful composition and grouping; in the contrasting lines of subdivision by which all the elevations are ruled; and by the studied distribution of ornament on easily recognised principles. But he seldom suffered from stiffness; his work reflects his disposition. A love of beautiful detail, delight in delicacy of ornament, and a realisation of the superficial value of the artistic crafts soften the effect of all the rules by which he designed. There is no artificial random or falsification of texture; in short, no hypocrisy about his buildings. Their stimulus is architectural in a real sense, and the conviction remains that when the fashions of his day are estimated as merely ephemeral the value of his witness to the lasting qualities of architecture will be felt.

The Imperial Institute building—temporarily, if not for good, the home of the University of London—in spite of some doubt, and in face of the extraordinary architectural mélange by which it is surrounded, carries itself without failure. The shop on the south side of Oxford-street, originally Waring's, impudently adjoining the Pantheon, the insurance building on the south of Ludgate Hill, and the refined front that was Bechstein's in Wigmore-street, are all vital things that we hope may survive. Collcutt did much besides these in street building. The Palace Theatre, the Savoy blocks in the Strand, the King's Hall, Holborn, have vigour, amounting in the theatre to power. He could make picturesqueness dignified, and was never vulgar. He would fail rather than succeed if he felt compelled to be commonplace. Perhaps this is a hard judgment of the big shop block in Oxford-street on the north side west of the Circus. Early successes were obtained in half-timber mixtures; and a stuccoed front in Fleet-street for Collinson & Lock—now forgotten and gone—should be mentioned as an early instance of the boyish spirit that played throughout all the life and work of this delightfully English architect.

To find Collcutt a year or two ago taking the field against our present educational fashions was no surprise to those who knew how honestly self-reliant he was an artist. It will be a sufficient criticism of modern methods of architectural draughtsmanship that one cannot imagine that they would commend a design by Collcutt in a competition. His works will live as genuine architecture—genuine in its expression of the character and aims of its author, as well as in their practical expression of purpose in design—and nothing in them will belie the honest, cheerful outlook on life with which his fellow-architects will always associate his memory.

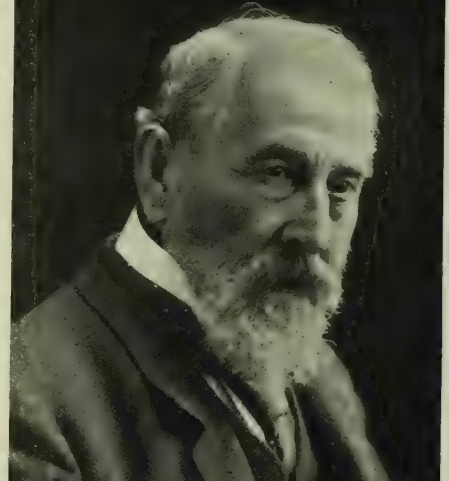

Photo: Elliott & Fry.

The late Thomas Edward Collcutt, P.P.R.I.B.A.

Among other buildings designed by Mr. Collcutt mention must be made of Lloyd's Registry of Shipping, and the offices in Leadenhall-street, for the Peninsula and Oriental Steam Navigation Company, and the decorations for many of their ships.

Mention has already been made of the Savoy Hotel and the Imperial Institute; the latter was built as the result of a limited competition in which five other architects took part.

Mr. Collcutt was President of the Royal Institute of British Architects for the period 1906–08, and in 1902 received the Gold Medal for Architecture. He was an Honorary Member of the Société Centrale d'Architecture de Belgique, Corresponding Member of the Société des Artistes Française, and at the Paris Exhibition of 1889 received a Grand Prix for Architecture. In December, 1921, he read before the Royal Institute of British Architects a paper entitled "A Plea for a Broader Conception of Architectural Education."

The funeral took place at Totteridge Church on October 11, and among those present were Messrs. Arthur Keen, Hon. Secretary R.I.B.A., H. P. Burke Downing, Frank Lishman, Gerald Unsworth, A. N. Prentice, Norman Evill, Stanley Hall, Llewelyn Roberts, H. Norton, Rudolf Dircks, Ian MacAlister, Secretary R.I.B.A. (representing the President R.I.B.A.), and Major H. C. Corlette (representative of the Australian Institutes of Architects).

THE LATE AUGUST SPENCER.

THE death of Mr. Augustus Spen twenty years Principal of the R.C.A., a man who had a great gift for organisat wide artistic insight and sympathy.

He was appointed by the Duke of Dev then President, in 1900, and cons supported both by him and by Sir John then Parliamentary Secretary, and S Abney, in reconstituting the staff an of the Royal College of art. Spenc already attracted the attention of Mr. Acland by his organisation of art teac Leicester, where in a few years he had fine art school and connected its wor many departments of municipal life. the author of the notable "Syllabus of Dr which is a landmark in the elementary t of art.

At South Kensington his organisin reconstituted the staff and work, a twenty years the College was devoted to the practical difficulties of associating th ing of teachers, its normal duty, w efficient system of education in the depa of industrial art. Spencer himself posses qualities of a good draughtsman, but little time for the exercise of his own water-colour drawing. He had a p instinct for sound craftsmanship and a pr understanding of materials and workm that made his judgments of real value.

Many must now be recalling his unostent generosity and sympathy to students in early struggles. A strong character wh a provincial town found no obstacle mountable to the attainment of his ide met the chronic problems of South Kens with a courageous determination to co-or all teaching with the requirements of pr industry. This he thoroughly unde from his earliest days, and with a simp direct artistic temperament. The partial ment of his ideal, through the inherent di of the problem, disappointed his zeal, a struggle tried his nature and health. To of the very large number of students and of friends he will always appear as the kind man, and to his colleagues as the man wrestling with the problem of teachi ernments artistic wisdom. The effects work upon the application of art to in in elementary, secondary and specialis education, though not manifest to the w large, are deep and will be lasting. Hi has consisted of the formation of a new tion of art teachers who are now, at ho in the dependencies, carrying out his ide who greatly mourn his death.

Students' Designs

The designs by students exempted fr R.I.B.A. Final Examination (with the ex of the subject of professional practice) on exhibition from October 20 to Octo inclusive, in the Galleries of the Royal I of British Architects, 9, Conduit-stree The exhibition will be open daily betw hours of 10 a.m. and 5 p.m.

The R.I.B.A. Board of Architectural tion Silver Medal for recognised sch awarded for the best set of designs subm this exhibition.

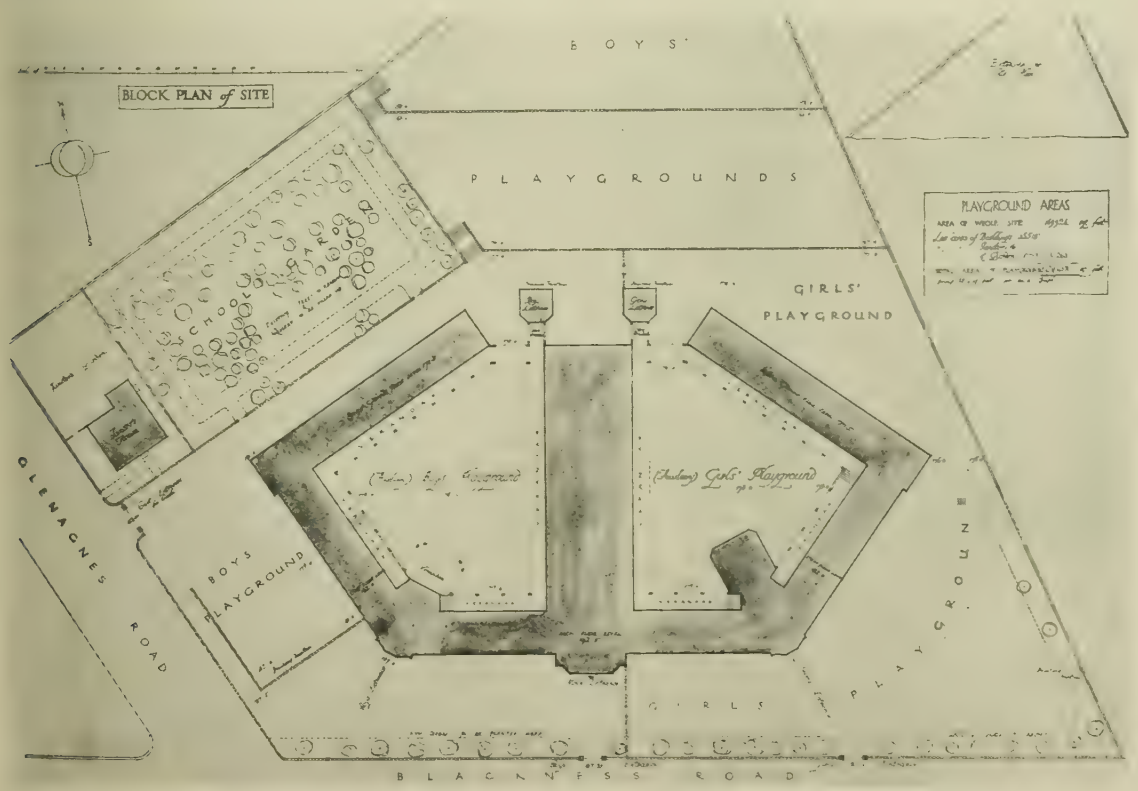
NEW SCHOOLS, DUNDEE

The assessor, Mr. John Arthur, in the course of his report on this competition, states that, having selected a short list of five designs, he called in an experienced measurer, Mr. Hugh Alexander Low, F.F.S. (Glasgow), to advise him regarding the probable cost of each. The following is from his report, the designs being placed in numerical order, *viz.*:—

No. of Design.	*Materials for Outer Walls.*	*Author's Estimate.*	*Measurer's Estimate.*
5.	Front wall, stone; rest brick and roughcast	£64,193	£71,032
6.	Old stone or brick and rough-cast, with new stone dressings to all openings	67,934	81,577
10.	Stone with artificial dressings	47,975	97,350
14.	(*a*) Stone	92,860	111,722
	(*b*) Terra-cotta brick with stone dressings	84,860	107,722
	(*c*) Rough-cast walls and stone dressings	76,860	102,722
15.	Reinforced concrete and rough-cast old stone for underground walls	69,328	77,679

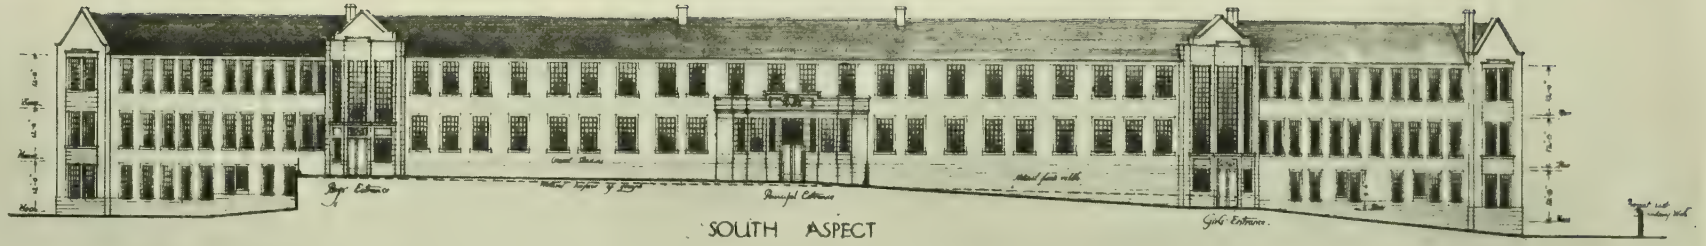
"It will be seen that the measurer's estimate, confirmed by the assessor, exceeded in each case the author's estimate by over 10 per cent., thereby bringing each of these competitors under the disqualification clause (No. 9) of conditions of competition. Comparing the measurer's rates, as applied to these five designs, to the remaining ten schemes with their respective reports, it is apparent they also are out of it with regard to probable cost."

The assessor states he had no option but to place the first three designs in the following order: (1) Design No. 6, (2) Design No. 15, (3) Design No. 5.



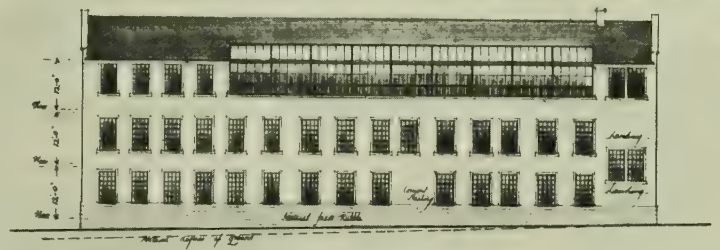
In placing these designs, the assessor states he has not taken into consideration the question as to whether the corridors should be open or closed. His views are that the arrangement in No. 15, with three opening doors to each class-room on the side next open corridor, is not to be recommended in Dundee's rigorous climate, apart from the fact that the doors opening out, as shown, partially block the corridor. Neither did he care for the intermediate ceiling in upper ground floor corridors for ventilation purposes as indicated in design No. 6.

"It will be noted that the design placed first, by Messrs. Maclaren, Soutar & Salmond [illustrated this week], is the most costly of the three, but this is due to the fact that the author is more generous in his floor areas. The first and third designs provide for 1,060 scholars, at the required floor area per scholar, as against 1,018 by the second design.



"Design placed first (No. 6) is origina' and excellent, well suited to the unlevel nature of the site, while the elevations designed on broad and simple lines are dignified and pleasing. The few criticisms which should be made are of minor importance, *viz.*: The library is badly placed and should be removed elsewhere; no fireplaces are shown in the cookery rooms; no gallery is provided in hall, but could, he thinks, be obtained if desired; the laboratories seem narrow for the proposed arrangement of tables as indicated; the two sewing rooms are on separate floors; and the playgrounds are somewhat cut up. The formation of playgrounds on the steep north-east corner of the site might be dispensed with and prove a saving.

"Design placed second (No. 15) is an admirable one in many ways, designed to be constructed with reinforced concrete and large windows, which somewhat sacrifices the scholastic feeling of his elevations. The arrangement of double quadrangles at or near the level of the principal floor is a very pleasing and useful feature, but the making up of the levels of these quadrangles, playgrounds, net-ball court, and quarry, would entail, he fears, the bringing in of a very large quantity of material from elsewhere. The entrances for junior and senior pupils might be better placed *vice-versa*; the steps at access to the lower ground floor cloakrooms are not good; the dining room is badly placed on upper floor, with only one stair to it common to boys and girls; the music room is too near teachers' rooms; main entrance hall would be rather dark; assistant masters' rooms are small.



"Design placed third (No. 5) is a scholarly scheme with a very good lay-out and many good features, but marred by some faults, the principal ones perhaps being the lowering of the central halls and north block of buildings by half a story below principal floor, thereby creating unnecessary excavation of site and losing the simple effect of planning which otherwise might have been obtained; the great height of stage in hall (8 ft. above floor), as likewise the front railing to Blackness-road (10 ft. high), dwarfing a good front elevation; the utilising of the south front for administration and laboratory purposes, and planning six class-rooms with a northern aspect."

HARROGATE INFIRMARY

In their report accompanying their design, placed first in the Harrogate Infirmary Competition, which we illustrate this week, Messrs. Elcock & Sutcliffe state, after perusing the conditions and visiting the existing hospital and the site of the proposed buildings, the opinion was formed that the following were the main ideals for which it was essential to strive: (1) To arrange the additions to the existing building so as to interfere as little as possible with the administration of the infirmary while the new buildings are being erected; (2) economy in capital cost and annual upkeep, with easy and rapid administration.

The report submitted with the design states:

"The buildings have been planned so that the extension could be erected without any interference with the working of the existing building. When the extension was completed, the patients could be moved, where necessitated, to the new buildings, and the alterations proceeded with to the older building. The present kitchen would be entirely inadequate for the complete building, and if enlarged would not be in a central position. A new kitchen unit has therefore been arranged between the existing infirmary and the extension, with an entrance gateway from Victoria-avenue and a central service court. The existing kitchen court is exclusively given up to the post-mortem department, the ambulance garage, and the isolation block.

"On the ground floor two women's wards and a side ward are provided for twelve, eight, and two beds respectively. A ward sister's office is centrally placed for all wards, and the necessary linen stores, store for patients' clothes, and the duty kitchen placed convenient for administration to the ward and side ward. The clinical room is placed opening off the corridor and convenient to all the wards. Near the entrance to each ward is placed the sanitary block, which includes a small cut-off lobby, and an outside balcony for dirty linen storage, with lavatories, patients' w.c.'s, and a sink room.

"Paying patients' wards are formed by removing the existing congested men's wards at the south end of the present building and enlarging the wards on both floors forming ward kitchens, linen stores, &c., and thus giving space on the ground floor for ten male paying patients, and on the first floor ten female paying patients, with the additional one-bed ward asked for in the conditions. Visitors to these wards therefore remain close to the main entrance of the infirmary and have not to travel through the general infirmary.

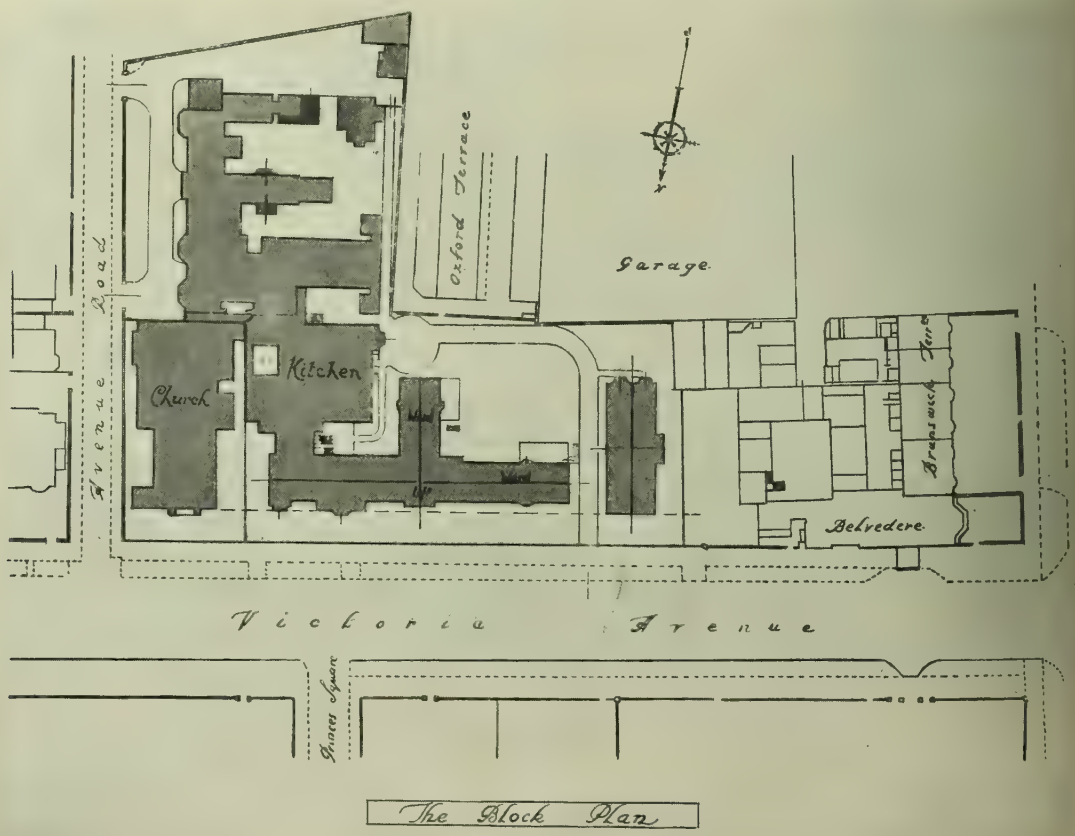
"The alterations shown to the outpatients' department could all be carried out without interfering with the normal work of the infirmary when the new portion was completed; this could be used and the alterations rapidly made to the existing outpatients' department.

"On the first floor wards are placed for men, of eight, twelve, twelve, and two beds respectively, with all offices and service rooms as specified for the ground floor wards, and with bed lift in staircase well.

"The system adopted for heating the hospital is by low pressure hot water passing through hospital radiators and heating coils, and forced circulation is arranged by duplicate pumps in the basement room, so that only small bore pipes are used to the radiators.

"Generally, the ventilation of the hospital is by 'natural' methods, but in the operating room this would be assisted by electrically-driven fans, and, if necessary, fans would be inserted in the roof of the nurses' home so as to ensure a steady extraction from each of the rooms through flues carried up above the top floor.

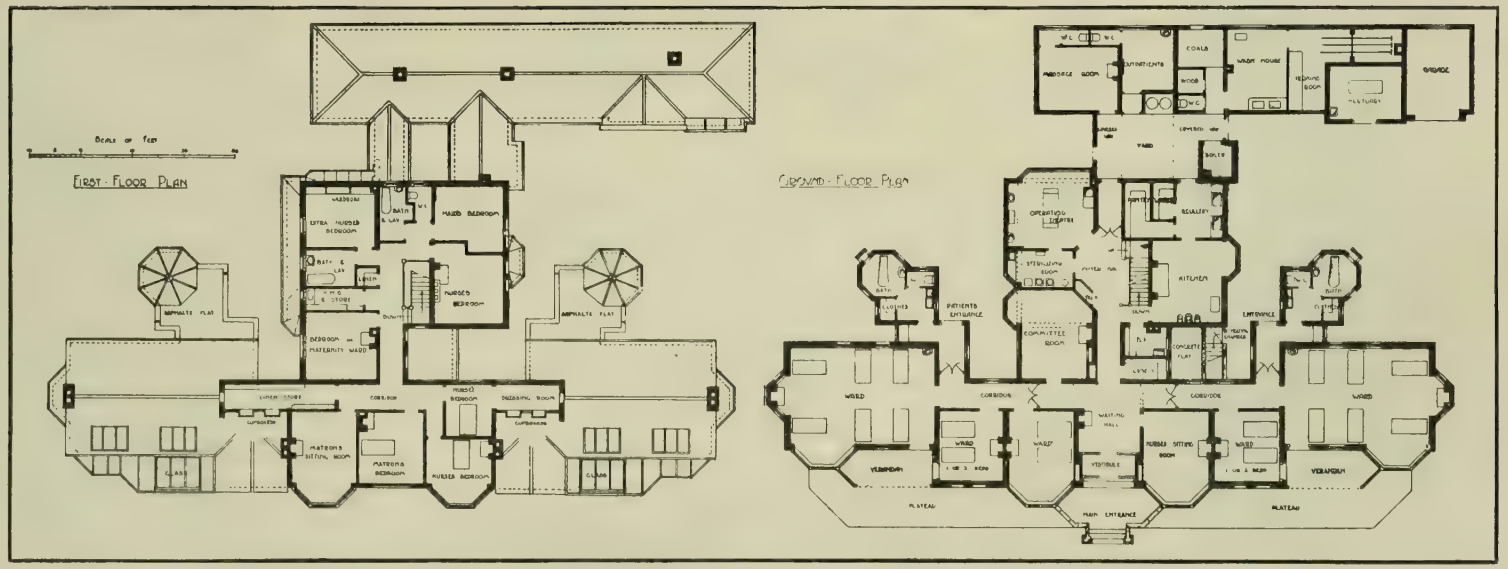
"The outer walls would be generally built of sound local stone to match existing work. All floors would be of fire-resisting construction, the first floors being formed of terra-cotta tubular flooring. All floor beams across the wards are formed in the thickness of the floors so as to have flush ceilings. The walls throughout are of hard plaster well worked, and in the wards bands of coloured tiles are inset. Coloured tile pictorial panels are inserted flush with the plaster. The flat roofs would be of concrete with a non-conducting layer of fine broken brick on top with a finish of cement screeding and asphalte forming the top cover. As far as possible, metal windows would be used throughout, and only a few different sizes would be used so as to standardise the patterns. Staircases be formed with granolithic treads and with dados of patent composition, which also be carried along the walls of all co and round the kitchen and laundry, ar round all sink rooms, w.c.'s, lavatories, rooms, &c."



On October 8, Messrs. Elcock & S were informed that they had been place in this competition for an extension £50,000, and on the following day the informed they had been equally succes another competition for a new hospital at hulme, which will cost between £250,0 £300,000; this design is also given this

NEW COTTAGE HOSPIT ALDERLEY EDGE

The new Cottage Hospital, at Alderley near Manchester, of which we publish il tions on p. 599, was completed towar end of 1923. The Hospital was formally on February 13, 1924, by Lord Sheffield, completely equipped in every surgica medical detail, including an up-to-date ope theatre, a complete set of steam ste apparatus, steam cooking fittings, and a equipped laundry.



The walls are of solid brick, pebble-d with cream spar on a white cement groun roof being covered with "Rosemary" The internal treatment is extremely simpl walls being left white plaster, but wher becomes soiled it is intended to apply washable flat paint. All interior woodwo unstained pitch-pine, varnished and r down to a very fine surface, and the whole is one of sanitary cleanliness and simp The floors of wards and corridors are of "T dura" patent composition, and where pine is used for floors this is nailed to a thickness of breeze concrete, which is la top of the reinforced slab.

The sole contractors were Messrs. L. Br Sons, Ltd., of Wilmslow, Cheshire; an architect was Mr. Edmund Ware, F.S. Liverpool.

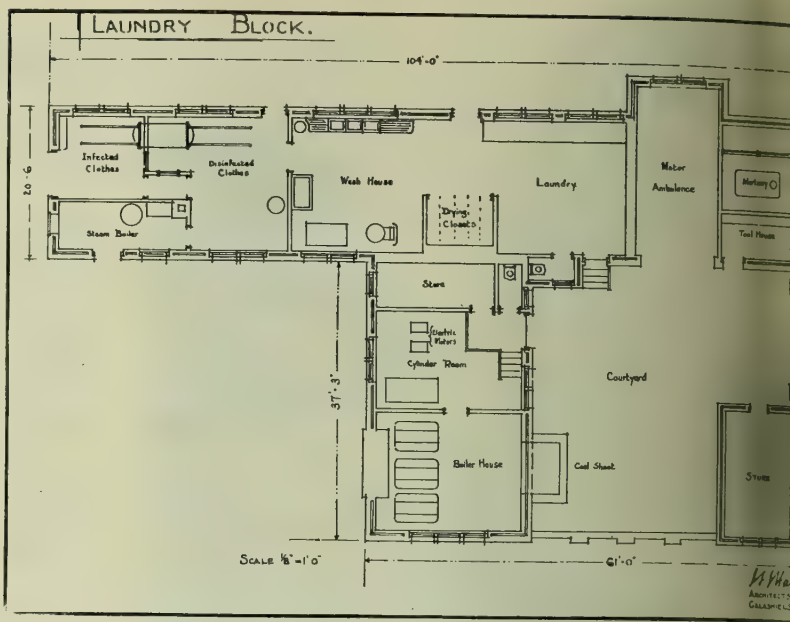
SANDERSON HOSPITAL, GALASHIELS

THE Sanderson Hospital for Infectious Diseases was opened at Galashiels last month. The buildings consist of (1) administration block, (2) scarlet fever pavilion, (3) observation pavilion, (4) outbuildings of laundry, washhouse, disinfector, mortuary, &c., and (5) entrance lodge.

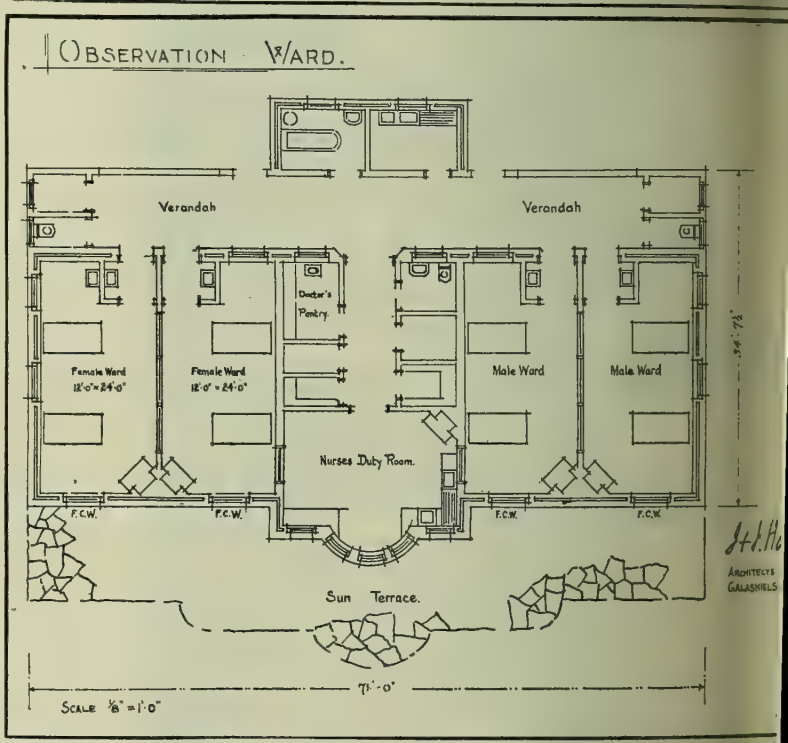
The main aspect of the buildings is south-east, and they thus get all the sunshine possible. The buildings are all 40 ft. or more distant from each other, and also from all the other boundaries. The ward pavilions are on the central portion of the site. The administration block is adjacent to the wards, with which it is connected by a covered corridor. The lodge commands the avenue leading from the entrance gateway, and the laundry, &c., block is placed on the low ground to the east.

The administration block has on the ground floor matron's parlour, doctor's room and office, nurses' dining-room, cloakroom, stores, &c., and kitchen accommodation is provided in a one-story building at the back. The covered corridor from the wards communicates with the kitchen and pantry by service windows, through which food is served for conveyance to the wards. In the basement there is cellar accommodation, and on the first floor there are six bedrooms, two bathrooms, with w.c.'s, wash basins, and sink fittings, while the roof space is utilised for box-rooms, stores, &c. Throughout the building has been equipped with labour-saving appliances. The kitchen is fitted with gas cooking range, ovens, boilers, hot closet and dish washing appliances.

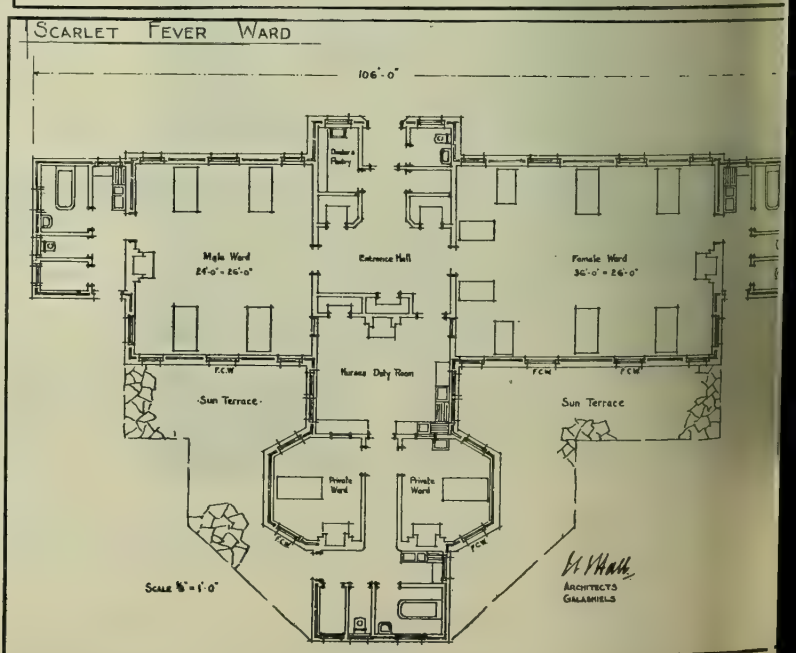
The scarlet fever pavilion has accommodation for twelve patients divided as follows:—A female ward for six patients, a male ward for four, and two private wards for one patient each. One of these private wards is fitted up as an emergency operating room. The nurse's duty room is placed in a central position, and by means of inspection windows the nurse can overlook each ward. There is a separate set of bathrooms, sinks, &c., for each ward. Opening off the entrance hall there are stores for linen and patients' clothes, cleaner's closet, crockery store, and press for toys and other things, and also a cloakroom and lavatory for the staff, and a doctor's room. A "sun terrace" runs along the south-east side of the building, and by means of casement windows in each ward the patients can be wheeled outside in their beds to enjoy the sunshine.



In the observation pavilion there is accommodation for eight patients in four two-bed wards, so that four different diseases can be kept under observation till their complaint has been diagnosed. A veranda runs the full length of this pavilion on the north side to give covered access to each ward, while still preserving their complete isolation.



The wards are heated by means of radiators on the hot-water system. Behind each radiator is a fresh-air ventilator, so that the air before entering the ward is heated. In addition, there are open fireplaces. Natural ventilation is relied on throughout the wards. As the buildings have been placed some distance apart, a pump has been installed to accelerate the circulation of the water, both in the heating and domestic water systems, which are led underground from the laundry block to the various buildings.



The floors of the entrance halls, lavatories, &c., are laid in terrazzo and concrete, tinted and formed in squares, and the walls have terrazzo or tiled dados of various heights. The walls of the wards are finished in hard-setting white plaster, with a brown tiled base and cove at the floor level, and all angles have been rounded. There are no projections to catch dust.

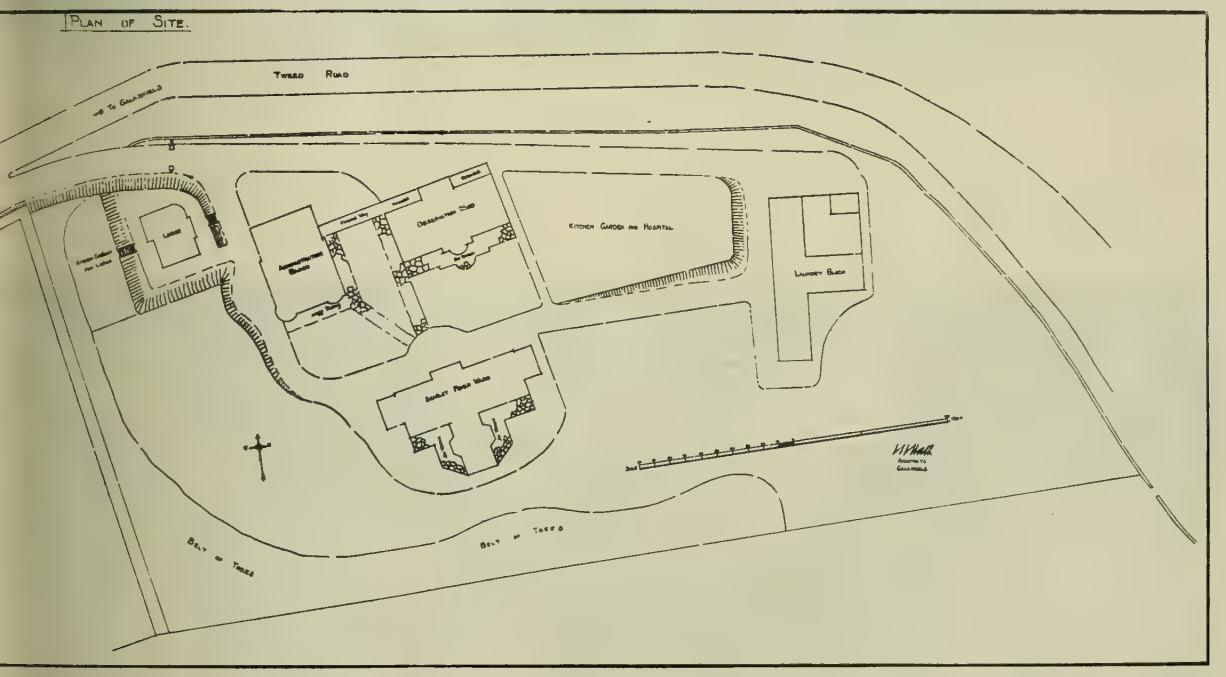
The doors of all lavatories open outwards, and are fitted with a special bolt, which in case of necessity can be opened from the outside by the nurse. Electric bells are fitted in all the wards, and can be used by any of the patients in their beds.

The drainage is divided into two separate systems—the soil and clear water drains—and each building has its own system of soil drains,

Sanderson Hospital, Galashiels. MESSRS. J. & J. HALL, Architects.

further, its own intercepting trap joins the town's sewer. The water rom the town's main, and the gas and from companies' mains. The hospital roughout with a complete system of nting, and in the administrative block one or two power plugs for use as nd shaded night lights are fitted in the wards. The contractors for the work were as follows:—

Excavator, mason, and joiner work, Messrs. Robert Hall & Co., Galashiels; plaster work, Mr. J. Gardiner, Galashiels; painting and glazier work, Messrs. J. G. Lindsay & Son, Galashiels; electric lighting and heating, Messrs. M'Kenzie & Moncur, Edinburgh; plumber and sanitary fittings, Messrs. R. Ruthven & Son, Galashiels; slater work, Messrs. L. M'Laren & Son, Galashiels; tile work, Messrs. Robert Brown & Son, Paisley. The entrance gate and iron railings were made by Mr. Thos. Scott, Melrose.



The architects are Messrs. J. & J. Hall, of Ladhope Vale, Galashiels.

New Chiswick Baths and Washhouses. Mr. Edward Willis, F.S.I., Architect. (*See p.* 604.)

CHISWICK BATHS AND WASH HOUSES

THIS building (see pp. 602–3) consists of eight slipper baths and one spray bath for men divided into four first-class and four second-class; and four of one class only for women with one spray bath; together with the necessary lavatory accommodation for both sexes.

The whole of the heating is by steam from a "Lancashire" boiler, 20 ft. long by 6 ft. diameter, and the condensed steam is brought back to the boiler house and again utilised for boiler purposes, thus reducing as far as possible the furring up of the boiler and economising in water and fuel. The usual safety bells have been fitted, and the hot and cold water supplies for all, except the first-class and the spray baths, are operated from the corridor. Ample water storage accommodation has been provided in the roof of the main building at a suitable elevation, and a fire hydrant fixed on the premises for use in case of necessity. The major portion of the brickwork is in lime mortar with rough-cast facings, except the main front, which is in best red facings, giving an elevation without extravagance; whilst the boarded roofs have been finished with red asbestos tiling.

The whole of the engineering work has been carried out by Messrs. Thos. Bradford & Co., of Manchester, under a sub-contract. The total expenditure was estimated at £16,000, including land, road widenings, &c.; but it is expected the actual cost will be substantially less than this amount. The quantity surveyors were Messrs. Young & Brown, 104, High Holborn, W.C.; the clerk of works, Mr. W. D. Mitchell; and the assistant in charge of the work, Mr. L. A. Cooper, M.S.A. The whole work was designed and executed for the Council by their Architect and Engineer, Mr. Edward Willis, F.S.I.

HOUSE DESIGN AND COSTS

IN the course of a paper, entitled "Reducing Costs by the Proper Designing of Houses: The Architect's Opportunity," read at this year's Conference of the United States National Housing Association, Mr. Ernest Flagg said there were two important ways of obtaining better results in building, viz.: by efficiency and by economy. Reduction of quality was not economy, though often mistaken for such; it might, indeed, prove a very vicious form of extravagance. Real economy was had by eliminating useless things, such as unnecessary time spent on the work, unnecessary space lost in the building, unnecessary materials used in construction; and by simplifying, standardising and taking more direct ways to reach certain ends.

The principles necessary to the design of buildings were not many nor hard to learn. The first and most important was reason or common sense. Reason was the highest gift with which they were endowed, and to expect that any real work of art could be made without its use was unthinkable. How, then, could a design in direct conflict with reason be a work of art? Yet one saw designs of that kind on every hand.

In architecture nine parts of beauty depended on proportion, and good proportions might be had without cost. With good proportions a hut might be an object pleasant to behold and without them the most expensive structure failed. Neither ornament nor anything else could compensate for bad proportions; while with good proportions little else was needed. Proportion in building was a most subtle thing. A design which had a grand air of majestic dignity might lose it all and descend to the commonplace by a change in pro slight as to seem incredible. To proportions one must have a knowle to use many other qualities, such balance, contrast, accent, rhythm, grace, clarity, variety, interest, symplicity and the like; but a mig good proportions was to design by a module or fixed measure, as was of the ancients.

Certain combinations of numbers w to produce agreeable proportions; th in the first few digits, and with the module one might use them with They were one to one, or a square; o or two squares; one to 3, 4, 5, 6, 7 The last three were generally used fo portions of Doric, Ionic and Corinthia respectively.

It might seem a long cry from t temple to the modern small house, b not so far as some might think. By ancient methods it was easy to desig using proportions which would produc and there was no way by which increa could so easily be had. The only c little training in the fundamental pri design—principles which if they we would open up a veritable mine of w ides adding immensely to the joy of

Beginning with the plans or drawin use of a module or fixed measure the cost of making them was so greatly that one could in a few hours do wo would require almost as many wee draughtsman's time. The module commensurability into all parts; tha nothing was more conducive to sp economy both in planning and build figured dimensions were needed, yet was left in doubt. Working drawings buildings might be made on a few sheet of a letter-head and the architect gi complete control as to be almost ind of help.

Closely allied to that was standard parts. For small houses there shou more necessity for special parts such commonly made than for a new alpha time one wrote. With proper parts t might be varied *ad infinitum*; but spe there must be, unless there was commens and that could not be had without When plans were made in the ordi without commensurability, occasions stantly arise when the standard part fit and a special one must be made. case occasioned almost as much tro expense as was required for the stan itself.

Building as he did it, so far as the was concerned, resolved itself into a m of routine. Conditions were always The design varied, but conditions w Thus speed was increased and the labo per man greatly augmented. Everyth went into the building could be m quantities and at times when most c to do so. The system did for building Ford's methods did for automobile with certain differences. Mr. Fo ardised the finished product; here parts only.

TOWN-PLANNING INSTITUTE

LEEDS TOWN-PLANNING PROPOSALS.

xth annual country meeting of the nning Institute was held at Leeds, y and Saturday last week, under the y of Mr. W. T. Lancashire (Leeds neer, and President of the Institute). embers were welcomed by Alderman upton, Chairman of the Leeds Cor- Improvements Committee, and Chair- he Leeds and Bradford Joint Town- Committee, who referred to the past proposals for the future in regard to rovements. He said the work of the Joint Committee was likely to have nportant influence in getting main ough from Leeds to other important nd in opening out the country so that ld have access to the sea.

ering the thanks of the Institute for tion, Mr. G. L. Pepler (Chief Town- Inspector of the Ministry of Health) s had taken a leading place in the town planning. The regional scheme Bradford and the surrounding towns l districts, for only on a regional l the problems of urban life be solved. nning had given enormous powers to orities. No longer were they largely o keeping pace with effects, but now l and guidance of the future develop- owns and districts had been placed ands they could deal with causes. tulated Leeds on its splendid parks; t that in the amount of park and d space that a healthy community Leeds held pride of place among the

Development of Leeds.

V. T. Lancashire, M.Inst.C.E., d a paper entitled "Town- Schemes and Proposals for Leeds," he dealt with the Town-Planning 09 and 1919, and the reconstruction ntral area of Leeds and the neces- consideration of the areas which later must be reconstructed.

a of Leeds for town-planning pur- er the Acts of 1909 and 1919, viz., 00 acres, had, he said, been divided schemes. Number one was so small s hardly worth considering; it con- y 6.01 acres, and an intimation was the Local Government Board to the cil that the Act was not intended uch small proposals. Nevertheless, of dealing with such small estates n-planning conditions was consider- e grounds previously attached to lences, now in numerous cases to be d laid out for small dwellings, ought re-developed on the old by-law lines. rse the trouble necessary to obtain ning powers for small isolated s too great to allow of that method ng the desired result.

er six schemes would embrace nearly of the unbuilt-on area of the city n small areas outside. A small por- e city had been included in the the Hunslet Rural District Council d system was looked upon as the f the proposals for the scheme, and vas first of all concentrated upon it. nature of the district left little choice ation of the ring road which, what- alue might be in some cases, was n in Leeds as vital. Under the tem the town had grown without rd to cross lines of communication, k of proper connection between the uburbs was most marked. There ross-communication between radial r large areas, and the advantage g road where already constructed ghly appreciated. When completed l value would be fully realised. able lengths of ring road lay out- resent city boundary, a good many miles lay in the areas recently taken into the city, and a comparison between the ease with which those portions within these areas were obtained and the delay attending the construction of the lengths outside the city was a point of much significance.

Seven miles of ring road had been made, and 2.3 miles were in hand; 2.2 miles had been ordered by the Council, the work having been undertaken to find work for the unemployed. The lengths of other roads and widenings carried out or to be carried out by the unemployed were:—Already made, 5.4 miles; in hand, 14 miles; ordered by the City Council, 6 miles. Generally, the width of the ring road was to be 100 ft. Some other arterial roads were to be 100 ft. in width, and the City Council had agreed to a width of 125 ft. in some cases where tramways on separate tracks were to be laid. In some cases it was considered advisable to lay the tramway tracks at the side of existing fairly wide roads on land outside the present width of these roads. This was only practicable when by reason of the frontage having little value it could be done with moderate compensation to the owner, or alongside a park or housing estate belonging to the Corporation. There were examples of the two former cases in the city, and plans for the last-named were in existence. When the road was wide enough for ordinary vehicular traffic this arrangement was good, as it was much cheaper than to upset nearly the whole of the surface of the old road and to make the necessary costly alterations to the gas and water mains and other services.

Before deciding upon the widths to be adopted for new roads, all departments of the Corporation and others were called together for consultation. It was decided that in the case of wide roads, services in the way of sewers, gas, water, electric light, telegraph and telephone mains should be laid in duplicate in footpaths of 20 ft. in width. In such a district no invariable rule as to widths of roads could be laid down; for instance, along the main road to Guiseley, near Kirkstall Abbey, the road in places lay on a hillside and a width of 60 ft. only had been obtained, this moderate width having involved a cutting 28 ft. deep. In carrying out the work it had been considered advisable to secure for the present generation as much benefit as possible by making only the half width of a 100 ft. road instead of the whole, though in certain cases the full width had been made as far as earthwork was concerned in consequence of the particular circumstances to be dealt with.

After dealing with parks and recreation grounds and zoning, he said, like many other towns in that part of the West Riding, Leeds was largely composed of back-to-back houses, of which there was a total of about 77,800, made up of three types—(*a*) 34,500; (*b*) 29,080; (*c*) 14,220. Houses in Type (*a*) abutted directly on the street and generally contained larder and coals in the basement, kitchen with set-pot and sink on ground floor, and one bedroom on first floor, there being one w.c. to two houses with entrance from the street. Houses in Type (*b*) generally had a 6-ft. open space in front and were built in blocks of eight with 15 ft. open space at ends, and generally contained wash-kitchen and coals in basement, a living-room with cooking range and scullery with sink on the ground floor, two bedrooms on the first floor, and one bedroom and bathroom on the attic floor. There was one w.c. to each house in an open space at the end of the block. Houses in Type (*c*) were built in continuous rows with 15 ft. open space in front, and contained wash-kitchen, larder, coals and w.c. in basement, with entrance from garden by means of area and steps; living-room with cooking range and scullery with sink and bath on ground floor, two bedrooms on the first floor, and an attic.

There could be little doubt that sooner or later Class (*a*) would largely disappear. In future generations a higher outlook on life and its requirements might bring about a partial disappearance of Class (*b*), but at any rate the re-housing of the population of about 140,000 occupying Class (*a*) houses, or 30 per cent. of the total population, would necessitate a great redistribution of population and a very material spread in the area to be occupied by houses. That fact, in addition to the requirements for the normal increase in population, proved the necessity for rapid transit to the outer fringes of the city and reconciled the inhabitants generally to the construction of new roads of a sufficient width.

A scheme for an unhealthy area of 65 acres was approved, and provisional orders were granted in 1896 and 1901. A great deal of work had been done in re-development therein; some streets 75 ft. wide had been constructed, involving heavy engineering work in bridges, retaining walls, etc.; 1,900 yds. of subway had been made in the new and widened streets. Some considerable areas had been sold off and built on, and it was the intention of the Council to re-develop it only for factory and business premises; but although 1,982 houses and shops had been demolished, there remained 986 houses still to be removed; the net area to be built upon amounted to about 16 acres. Since the taking up of the available sites was slow, it was possible that the Council might reconsider the proposals for rebuilding and decide to rehouse some of the inhabitants thereon.

The centre of the city was well furnished with fairly wide streets running north and south, but the streets running east and west were certainly deficient in accommodation for present-day traffic. Wherever the Corporation had surplus lands to sell, it did so with the obligation thrown on to the purchaser to submit plans to the Improvements Committee for approval in the matter of elevation. In important cases outside architectural advice was obtained. For instance, when the remaining site was sold in City-square, the Leeds and West Yorkshire Architectural Society was asked to give names of three prominent architects, from which the Corporation selected Sir Reginald Blomfield to collaborate with the architect for the new "Majestic" Cinema. It was the intention of the Corporation to give special attention, from the architectural point of view, to the rebuilding of premises along the half-mile or so of street improvement running from the Town Hall in an easterly direction. Difficulties, of course, arose in these matters, as prospective purchasers were inclined to argue that they must have a free hand or they would not buy, and would go elsewhere to start their business, but the city could wait quite as well as the private individual, and it was its duty to see that such important matters, if to be done at all, should be well done. The importance of the matter for generations to come was such that a local authority, impressed by its duty in this direction, would, it was hoped, be able to resist any inducement to vary from the course it ought to pursue.

Mr. R. H. Mattock, Chief Surveyor to the Leeds and Bradford Regional Joint Town-Planning Committee, then read a paper on the work of that committee, which we hope to report in our next issue.

In the afternoon the members visited various road improvement schemes in the neighbourhood, and were received at the Art Gallery by the Lord Mayor of Leeds in the evening.

On Saturday visits were paid to Temple Newsam, Roundhay Park and various improvement schemes.

Rome Scholarships.

The Rome Scholarship in Decorative Painting for 1924 has been awarded to Mr. Robert Lyon (Royal College of Art), and the Rome Scholarship in Sculpture for 1924 to Mr. John R. Skeaping (Royal Academy Schools).

STEEL HOUSES AT THE DOMESTIC WELFARE EXHIBITION, GLASGOW

On Monday, October 13, the Domestic Welfare Exhibition was opened by the Duke of Atholl in the Kelvin Hall, Glasgow.

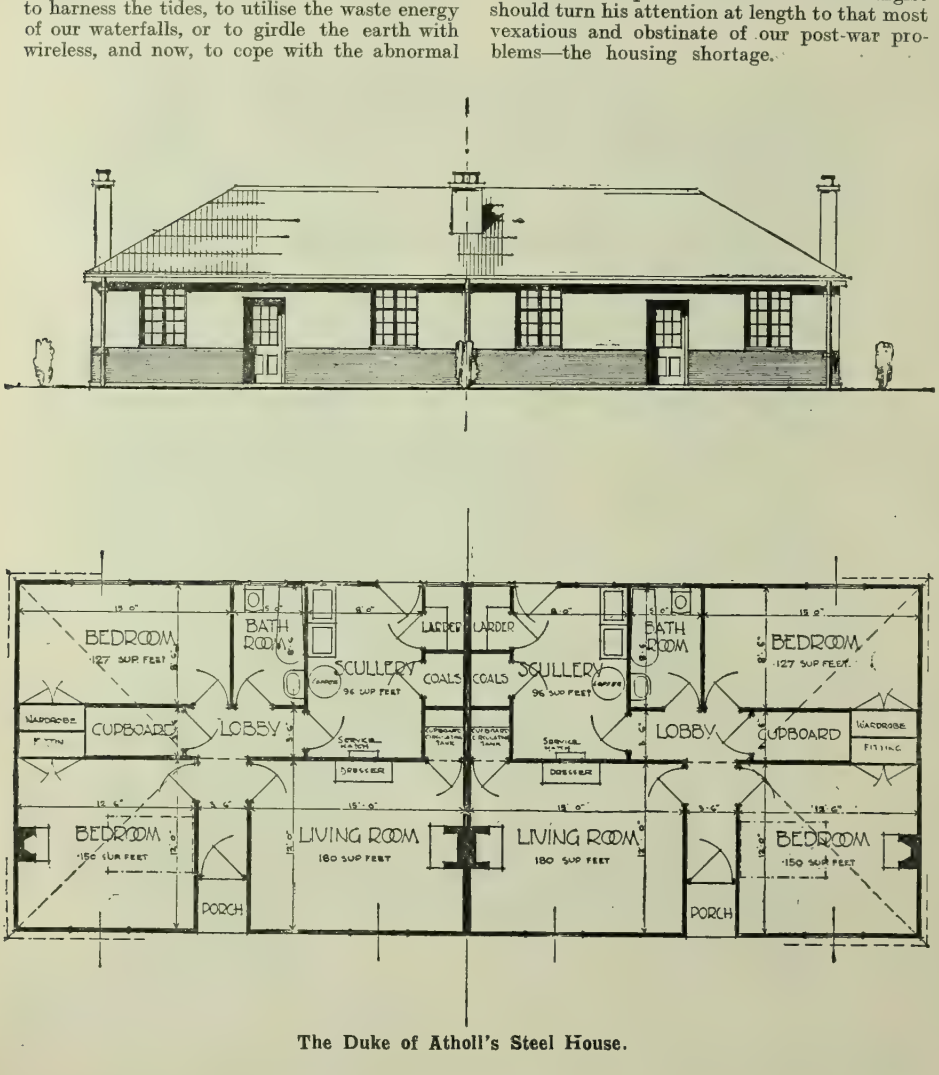
This is another of the series of the Housing and Health Exhibitions under a new name, but on this occasion the Glasgow Corporation, who are the promoters of the venture, have concentrated more particularly on the question of domestic and personal welfare, house finishing and equipment, labour-saving and smoke-prevention devices, and other matters that tend to make for health.

There are interesting sections showing artisan work, models, paintings, photographs, inlaid work, embroidery, sewing, knitting, and arts and crafts of all kinds, and the competitions in photography and artisan work have attracted large numbers of entries. The most outstanding exhibits are two showing the types of steel houses developed by the Duke of Atholl, in co-operation with Messrs. William Beardmore & Co.—one a complete cottage of three bedrooms, a living room, scullery and washhouse, bathroom, and all the necessary smaller apartments; and the other the lay-out of a three-roomed house of a similar type. The two steel houses are attracting enormous attention.

Steel houses! The very idea is new and arresting to the public mind. Yet this idea is simply a reflex of the stress to which ingenious brains are being subjected to ameliorate the lot of man. In the realms of art and science enormous strides are daily being made and many efforts directed towards better conditions of life.

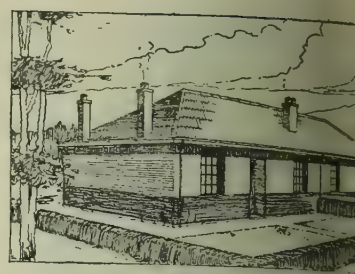
Daily, almost, schemes are being promulgated to harness the tides, to utilise the waste energy of our waterfalls, or to girdle the earth with wireless, and now, to cope with the abnormal shortage of houses, comes the astonishing proposal to erect houses of steel.

If a Rip Van Winkle, with the genius and inspiration of a Burns, were to awake, what a play of ideas he could introduce into an imaginary dialogue between the old and the new, between a stately Scottish castle and a modern house of steel. One could easily imagine the stout old massive pile to say:—



"Then down ye'll hurl (deil nor ye never rise!)
And dash the gumlie jaups up to the pouring skies!
A lesson sadly teaching, to your cost,
That Architecture's noble art is lost!"

and the modern edifice reply in sarcastic vein:—



"Fine Architecture, trowth, I needs must say't o't,
The Lord be thankit that we've tint the gate o't."

Certainly, if the Duke of Atholl's proposals are carried out and houses of steel become universal, then economic pressure has compelled modern man to "tint the gate" of ancient architecture.

In support of the "Atholl Steel Houses," Messrs William Beardmore & Co., Dalmuir, Glasgow, claim that this is an Age of Steel—an era in which, in one department of industry after another, this sturdy product of the melting furnace and rolling mill has ousted wood, stone, concrete, bricks and mortar, and a host of other building materials. It is but a natural development that the metallurgist should turn his attention at length to that most vexatious and obstinate of our post-war problems—the housing shortage.

The Duke of Atholl's Steel House.

The Duke of Atholl's Steel Ho

The Atholl Steel Houses, manufactu Messrs. William Beardmore & Co., L Glasgow steel manufacturers, ship build engineers, to designs by the Duke of suggest a definite solution to this grave problem—a solution, too, which, as providing permanent houses in a frac the time formerly required for build intended to revolutionise methods industry, and make a contribution t wider employment as well.

The use of steel for walls and roofs of apart from girder-framework, is, of cou new. Light sheds, pavilions, and even dw houses of a semi-permanent nature, are e instances of this. But there is a vast dif between the light flimsy steel sheets em in such structures and the heavy steel used in the new Atholl steel houses—f latter are constructed on the same pri and of the same material as a ship. Th experience and high reputation of the mak shipbuilding, boiler-making, and similar plate work, will be familiar to British everywhere.

The framework of Atholl houses is o girders, the outer wall of heavy steel p and the inner of a non-conducting m with an air-space between, such as will ma equable temperatures in the rooms i climate. Obviously, such a house is against damp, vermin, and fire; and th being treated with a special composit the inner side, will not be subject to cor tion.

The types at present under construct eligible for the full Government subsidy, designed to meet the requirements of the w man, though their high degree of fini ample wardrobe, press and cupboard make them suitable for people of any t profession. The sections are standardi that it is a simple matter to make ho a larger type.

There are no extras to buy over and ab quoted price, and a definite date can be g delivery. We are informed the house erected on a previously prepared fou easily in a fortnight's time, rea occupancy.

The Beaux Arts Gallery.

The collection of over a hundred and drawings, at the Beaux Arts Ga Bruton-place, includes a good deal of int work of a varied kind. The honours of t are probably with the late Jules Lesse could handle both pure landscape or h with real distinction. Whether it w subjects as the sea front at Brighton, French chateau, he always had a point as regards colour and general effect wh worth giving.

Concrete Mixers.

Messrs. The Ransome Machinery C are supplying the concrete mixers for th Harbour Bridge Contract, the contra which are Messrs. Dorman, Long & C and they have also recently secured for 27 steam-driven concrete mixers, with engines, for the Central Indian C through the India Office.

RCHITECTS' AND ILDERS' INQUIRY BUREAU

Moving Shuttering.

was much interested in the article Methods of Cottage Construction" st issue, specially in the reference to uttering. I should be very glad if l give me further particulars of

"S. D. D."

[REPLY.]

ef feature of moving formwork is the unt of shuttering necessary for the concrete walls. It can be applied lengths of walling or to circular h as silos or gas-holder tanks, and her of wood or steel; if steel forms a smooth surface which needs no atment is obtained. Moving forms used for the largest and the small- of building; in the construction of rain elevator at Hull a system of rms was used by which the whole side and interior walls were poured rom a centrally-situated placing his was probably the most difficult e application of moving shuttering pted in this country, and very care- sation was necessary. A shutter- 10 ft. high was used, and as the in height this was raised simul- ver the whole area of the building number of jacks, which were oper- er on the sound of a whistle.

ller buildings, such as our corre- robably has in mind, the problem simpler one. The principle of the the repeated re-use of the shutter- er steel or wood. Instead of the l method of erecting shuttering to ent height, filling in, and then rther shuttering on top of that place and again filling in, while e whole of the shuttering in place wall is completed, the shuttering e first course of the wall is raised use of for the next course above, until the wall is completed to the required. Shuttering used on the system may be of any height, but y between 1 ft. 6 in. and 3 ft. The which it may safely be raised de- large extent on the nature of the eing built, and the height of the the concrete must be allowed to itial set and to be so firm that it o out of shape when left unsup- for cottage walling it would be in practically all cases where a h Portland cement is used to raise ing 24 hours after the concrete is or a small building it would be to have the shuttering of such a the men on the job could pour a ourse in one day and commence ng at the same place as on the ; thus the forms would always be hours, and there would be no l by the operatives having to wait concrete was setting. There are types of patented steel forms on but they can be readily made of site, although, if wood forms are surface is not left so smooth as is used. In small work many raising the forms are in use, and realises the principles of moving shuttering it is a simple matter to devise a method on a small job. Unless interlocking steel forms are used it is necessary first to erect uprights at intervals around the building on each side of the walls to act as guides for the shuttering. These uprights are usually provided with grooves in each side in which the boards or sheets of metal are placed. Sometimes the shutters are kept in position by dowels, but it will generally be found that the weight of the concrete pressing against the timber will prevent it from falling inwards or slipping downwards, while the uprights in which it is slotted prevent it from bulging outwards. If a shuttering of up to 3 ft. in height is used it can be raised by two men lifting it upwards in the grooves into which it is slotted, but for a deeper shuttering it would probably be necessary to force the shutter upwards by some means or other; a simple method is to put a block of wood on the platform on which the men are working and use a plank as a lever acting on the bottom edge of the form. Raising is considerably facilitated if the forms are oiled on the inside, or, better still, if wooden forms are used, face them with thin sheet metal in order to present a smooth face to the concrete and reduce the friction.—ED.]

Concrete Blocks v. Brickwork.

[REPLY TO MR. J. WOOLLARD.]

SIR,—The whole difficulty of satisfactory concrete block construction has been and is now the uncertainty of arriving at that happy mean between the richness that keeps the water from without while holding the condensation upon the surface within, and the porosity that admits the water from without though absorbing the condensation from within. The man who can solve the problem with some certainty will have given a great impetus to concrete block construction, but at present success in this direction sometimes appears to have arrived more by luck than judgment.

As to speed, I am very sceptical of Mr. Woollard's figures. The operation of laying down the trowel between each unit, handling with both hands the heavy block, setting, adjusting and pointing and bedding the cumbersome thing seems to me very much more than a three-brick job, though there is no doubt that there are bricklayers working to-day who would not beat it. The comparison looks rather as though between a good bricklayer laying blocks and a poor bricklayer laying bricks. I know of several men who are laying their thousand a day regularly, and any of these would, I feel convinced, romp home with six or seven laid bricks before the block was laid.

As to cost, it is a remarkable thing that with very few exceptions the speculative builder is choosing bricks almost everywhere, in spite of the acute shortage, and in spite of the adequate supplies of cement and aggregate available. What has Mr. Woollard to say to this?

"BRICKS."

"Rendering Accounts."

[REPLY TO YOUNG BUILDER.]

SIR,—From an architect's point of view, and no doubt to some extent from a layman's, it is most desirable that every item, and every time-sheet concerned, should be accounted for in the builder's account. Builders who would observe this from the outset would save very much trouble and delay such as is often caused by frequent back reference to explain and amplify items that have been lumped together in a way that is impossible to check. An architect or quantity surveyor can hardly give a conscientious award otherwise, and a layman will be inclined to suspect accounts that are not fully detailed and expressive of a thorough business organisation behind them.

A fair net profit to a builder would be 10 per cent., and to this a percentage should be added for establishment charges, and this will vary according to the extent or economic running of the establishment. The percentage is not empyric, but should be assessed upon the actual figures of a previous fair period of running experience, such as "Young Builder" appears to have had. It should be quite simple for him to trace his accounts in his overhead charges as carried by the turnover of a particular period, and the calculation will be a useful index of the efficiency of his business.

"ARCHITECT."

Movable Structures.

SIR,—I should be obliged if you would advise me on the following points: I am about to erect a small repairing garage on a main road, the plan of which the council will not pass because the district is residential. In consequence of this I propose to build the structure on wheels and should be pleased if you would give me your assistance in the following:—

What is the largest building on wheels allowed by law?

Must the building have its own floor, or could the ground be used as the floor?

Must one pair of wheels be pivoted to allow for steering? Also, is there any specification as to the size or number of wheels used?

"A. G."

Made Ground.

SIR—What would be a fair, safe load to assume upon fairly mature and consolidated made ground?

On a site under which the natural surface is very many feet below the made-up surface, the cost of going down thereto with the foundations of a small house would be prohibitive and out of all proportion to that of the superstructure. There must, however, be a limit within which the resistance of the made ground may be relied upon and which can be dealt with by spreading the weight of the superstructure either upon a wide spread of reinforced concrete foundations, or upon a continuous reinforced concrete raft.

Personally, I thought ½ ton per ft. super to be a very conservative estimate for any but the most loosely tipped rubbish, but I should like to hear other views upon the matter.

"NERVOUS."

Sand Lime Bricks.

[REPLY TO "COMPETITION."]

SIR,—I have used these bricks as long as 20 years ago, and they can be seen standing the weather, &c., as well as other bricks in the side and rear walls of the Norwich Union Life Insurance Society's Head Office in Norwich. They were recommended, and I simply bought them and used them. I don't see why they should not be more extensively used. Those I used were made by a patent process, but the plant, I fancy, was rather expensive to put down and the undertaking was abandoned, although in a good district for both sand and lime, and the plant sold, I believe.

For economical building, in my opinion, patent materials and processes should be avoided.

GEORGE J. SKIPPER, F.R.I.B.A.

Abandoned Work.

[REPLY TO "BITTEN."]

SIR,—If "Bitten" who, from the tenor of his letter in your last issue, seems to have a "little knowledge," had only known this, that most respectable builders make it a rule not to tender for works costing more than £500 unless quantities are supplied them, he would not have found it necessary to write his letter. Builders are put to great expense in pricing quantities, often unsuccessfully; it is unreasonable to expect them all in competition to take off each his own quantities, hence one "taking off" is done by the surveyor and copies supplied to each builder. If the work is abandoned surely this work must be paid for; it is done and finished.

"SURVEYOR."

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

A General Election has been decided on as the result of the Government's heavy defeat. Parliament has been dissolved and polling will take place on October 29.

Cost of Parlour and Non-parlour Houses.

Mr. Wheatley, Minister of Health, informed Sir K. Wood that returns from local authorities showed that the average costs of parlour houses contracted for by such authorities during each month since January last were as follows:—Average Cost:—January, £445; February, £439; March, £459; April, £443; May, £474; June, £462; July, £494; August, £491.

The average prices of non-parlour and parlour houses (including flats) included in contracts let by local authorities in the Metropolitan Police District for each month since January were as follows:—

1924.	Average cost per house or flat (non-parlour).	Average cost per house or flat (parlour).
January ..	£437	£473
February..	402	491
March ..	468	512
April ..	484	597
May.....	438	512
June.....	493	527
July.....	600	—
August....	510	548

Houses Under Construction.

Mr. Wheatley informed Mr. T. Thomson that on September 1 last 52,930 houses were under construction in connection with State-assisted schemes; the number under construction on January 1 last was 18,975.

The Rating Bill.

Lieutenant-Commander Fletcher asked the Minister of Health if he was in a position to make any communication regarding his negotiations with associations of local authorities and other interests concerned in the draft Rating and Valuation Bill issued by his department on September 15, 1923; and if there were any immediate prospects of legislation on the lines of the Bill being introduced.

Mr. Wheatley said that as a result of the circulation of the draft Bill to Associations of local authorities and other interests concerned, many useful suggestions had been received. The work of dealing with these suggestions was still proceeding, but he was not yet in a position to make any definite statement on the prospects of legislation.

Building Committee Scheme.

Mr. Wheatley informed Mr. E. Simon and Mr. Briant that the arrangements for putting into operation the proposals of the National House Building Committee for increasing the building resources of the industry were progressing rapidly but had not been completed. He hoped to announce very shortly the appointment of a representative committee whose principal duty would be to give practical effect to those proposals.

A Disqualification.

Sir C. Yate asked the Minister of Health whether he had issued an order that any member of a rural district council who applied for and receives a certificate entitling him to the Government subsidy for a cottage he was erecting could not hold his position on the council and receive the grant, and if so, for what reason?

Mr. Wheatley said he had not issued and had no power to issue such an Order; the disqualification arose from a provision in the Local Government Act, 1894.

Building Lines.

Lieutenant-Commander Fletcher asked the Minister of Transport if he had yet ascertained what additional powers he required to enable him to ensure the general prescription of adequate building lines so that the future widening of arterial roads might be possible as it became necessary?

Mr. Gosling said he was aware what additional powers were necessary to secure the very desirable results at which the honourable member aimed, and he hoped it might be possible to frame generally acceptable clauses which could be embodied in any future highway legislation of a general character.

Scheduling Roman Camps.

Mr. E. Harvey asked the First Commissioner of Works whether he would consider the advisability of scheduling the Roman Camps at Cawthorne, near Pickering, under the powers given him by the Ancient Monuments Protection Act?

Mr. Jowett said unless in cases of immediate urgency, his Department awaited recommendations from the Ancient Monuments Board before scheduling monuments. He was not aware that there was any need to depart from this practice in the case of the Roman Camps at Cawthorne. He had no doubt, however, that the Camps would be recommended for scheduling in due course.

Two-roomed Houses.

Lieutenant-Commander Fletcher asked the Minister of Health how many two-roomed houses had been sanctioned for construction by his department since the accession of the present Government to office?

Mr. Wheatley said that information in the form desired was not available as detailed particulars of accommodation proposed to be provided were not required at the time of giving approval to a local authority's proposals where the houses to be erected would fall within the general limits of size laid down by the Housing Act, 1923. Approval had, however, been given under the Housing Acts to the erection of 316 dwellings having a floor area of less than 620 sq. ft. in the case of houses or 550 sq. ft. in the case of flats; of these 180 had been approved in connection with slum clearance schemes and 136 for aged miners' homes. These figures substantially covered the two-room accommodation approved for erection by or with the assistance of local authorities.

Houses Approved.

Mr. Greenwood informed Captain Bowyer that 161,441 houses had been authorised to date under the Housing, &c., Act, 1923. On September 1, the latest date for which information was available, 26,347 houses had been completed and a further 50,524 were in course of construction.

Mr. D. G. Somerville: Is it not a fact that a very much larger number of houses have been built by private enterprise in addition to these subsidised houses?—Sir H. Croft: Have any of these houses been built under the present Minister?—Mr. Greenwood: A large number of the houses for which I have given figures were built under the present Minister.

Pressed further by other hon. members, Mr. Greenwood admitted that all these houses had been built under the Chamberlain Act during the time Mr. Wheatley had been in office.

York Housing Scheme.

The tender of Messrs. F. Shepherd & Son, York, amounting to £130,297 10s., for the erection of 300 houses under a steel frame system, has been accepted.

Wages on Public Works.

The Public Works Conciliation Board wish it to be clearly understood that the rate for the area beyond the City and County of London (the rate for the City and County of London was given in our issue of last week) and to the limits of the Metropolitan Police Area be not more than one penny less than the basic rate (1s. 3½d.) in the City and County of London.

TOWN-PLANNING

I.—ANCIENT TOWN PLANNIN

MR. WILLIAM HAYWOOD, F.R.I.B.
giving a series of lectures on "Town
ning" at the Birmingham Universit
the course of his first lecture he said
consideration of town building duri
period 2500 B.C. to the fall of Rome
that where towns were contemporary w
early and unaided struggles for the s
of their inhabitants, no ordered plannin
to be expected; and, as a matter of fa
street plan of such towns was usua
casual as that of a nineteenth-century

n more difficult is the question of
the money for maintaining the
during the proposed three months'
course. It is improbable that em-
l be able to see their way to pay much,
anything at all, towards the expenses
of potential apprentices. A suggestion has been made by the representatives of certain local education authorities that a compromise might be effected by a student spending one week with a building contractor in the shops or on a contract, thus earning wages; and the next week, possibly at reduced wages, go into the local technical school for theoretical training. This plan has obvious difficulties.

Then there is a suggestion that maintenance charges on a fixed scale for the trainees might be partly provided out of the rates. But, even if local authorities, who are at present extremely anxious as to their financial position, because of the rising cost of outdoor relief, are prepared to pay towards the expenses of the board and lodging of youths trained for one selected industry, the problem is not solved. What guarantee can be devised so that the lads when trained, possibly at the expense of local rates, will remain in the locality on house-building work? They will be tempted to migrate to better jobs on commercial buildings in other districts, unless such movement of labour is restricted by a written agreement.

It is more than probable, therefore, that the only way of overcoming the difficulty of maintenance will be by taking the money out of existing maintenance funds that are now in the possession of local education authorities. Under special arrangements, such authorities receive a grant that has lately been increased from 6s. to 9s., according to the number of attendances at elementary schools. Can this fund be utilised to provide board and lodging for trainees during the three months' course?

There are many other difficulties that will have to be faced and overcome before the proposed scheme can become practical. There is, for example, the question of whether the trade unions concerned will agree that tests of the efficiency of the lads should be applied at the conclusion of each course.

Fortunately, in this country, we have the advantage of the experience of a similar scheme that was started in Australia early last year. According to the evidence of one of those most intimately connected with the initiation of special courses in Australia, who is now in London, they are proving to be most successful. The Operative Associations at first were strongly antagonistic, and the employers were suspicious. But the training is being given, and the building industry in Australia is being recruited by more efficient craftsmen. Quite a number of lads in Australia in the concluding tests for bricklaying laid in an eight-hour day on straight work from eleven to twelve hundred bricks. Carpentry and plumbing need, of course, far longer to learn than rough brick-laying, but all the same Australian experience proves that craftsmen able to build cottages can be trained on intensive lines. It was always said before the war that it took three years to make a soldier, but many a man in 1917 found himself in the trenches after a period of training at home that the old soldier would have regarded as absurdly inadequate. So, in the building industry, we may learn before long, and certainly Australia can teach us a lesson in this respect, that carefully devised education given in our technical schools in short courses can help to approximate the supply of skilled building labour to the demand.

Bournemouth Pavilion.

Messrs. Home & Knight, architects, of Russell-square, inform us the Minister of Health has sanctioned the first contract for the Bournemouth Pavilion. Work will be commenced on Monday.

REINFORCED CONCRETE DESIGN *

This is a remarkable book; it may be considered from two points of view—the technical treatment and the author's views on the principles of design which he sets out in an extremely interesting, albeit rather an aggressive and heterodox manner. We will deal first with the technical treatment. The author does not use the standard notation now almost universally adopted in this country, but one of his own "based on the system in use in American text-books. These, at the present moment, are the best literature on the subject." The result is that the notation is neither the standard British nor that found in the American text-books. But we like the reference to the American text-books being the best "at the present moment," with the subtle inference that, now Mr. Manning's book has appeared, this is no longer true. Frankly, we hardly think it is, and that the present book compares in many respects favourably with the American books which are usually free from the personality which is so strongly marked in Mr. Manning's work.

The book covers a very wide ground and deals in Part I, divided into eight chapters, with stresses on structural members. The treatment here is mostly on orthodox lines and is exceedingly good. Part II deals with design of members and includes a treatment of continuous beams which is new to us. This part comprises fifteen chapters and covers a wide field. Part III treats of the design of structures and deals with buildings, continuous footings, water-towers, bunkers, bridges, retaining walls and chimneys. This treatment will, we think, be of greatest value to readers who have already studied an elementary text-book on the theory of reinforced concrete; it is written in a clear style, is full of "pep," and contains much valuable practical information and advice which will be of great value to young designers.

In Table I we are given standard working stresses; this is divided into two columns, one "Standard Design," the other "Competitive Design." The stresses in the second column are 25 per cent. in excess of those in the first, thus frankly confessing that the strength of a "competitive" design is only four-fifths that of a "standard" design.

We next draw attention to a paragraph on "Cut Designs," and think it best to quote: "It may be necessary to reduce the cost of a design by reducing the quantities. This may arise through either of the two following causes. Firstly, very keen competition to secure a low tender. Secondly, attempts to retrieve a very low and unprofitable tender which has been based on faulty pricing or a mistake in the original quantities. When this second reason is further complicated by the necessity to produce satisfactory calculations of strength to lay before the owners or governing authority, then desperate measures are called for." Although Mr. Manning warns against undue cutting, we do not think that statements like this should appear in a serious text-book which "aims at establishing methods of design suitable for use in a civil engineers' office."

Obituary.

The death took place recently of Mr. P. H. O. Summers, head of the firm of Messrs. Jabez Summers & Sons, builders' ironmongers and merchants, of London-road, Kingston-on-Thames.

The death occurred recently of Mr. A. H. Tout, a well-known builder and decorator of Hendon.

The death has occurred, at Ripon, of Mr. Mavin Ramshaw, who had carried on business as a builder and contractor at Haswell, co. Durham.

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A. (Barrister-at-Law), F.R.San.Inst.

XV.—BREACH OF CONTRACT.—SPECIFIC PERFORMANCE.—BANKRUPTCY OF CONTRACTORS.

If either party, without lawful excuse, abandons, or refuses to fulfil, his part of the contract, before completion, he is liable for breach.

It is not an acceptable excuse to plead that he did this because he *thought* the enterprise was unlawful, or that he signed under an error of judgment. He must be able to prove to the Court that it was, in fact, unlawful, or that his signature was obtained by fraud, causing his refusal to fulfil his undertakings.

On the other hand, the aggrieved party must be able to prove that he himself has at all times been able and willing to perform, and has not in any way unduly hindered the other party from performing, the contract.

In general, strikes, lock-outs, permission or licence, variations or extras, etc., cannot be pleaded as excuses for non-performance, undue suspension or delay, unless the defaulter—generally the contractor—can produce proof of orders from the aggrieved, showing either definite novation or some taking over of responsibility on the part of the latter.

Even if the employer has, under the conditions of the contract, lawfully entered and taken possession of the works before completion, or if he has held back payments honestly, the contractor is still open to a charge of breach, if the Court is satisfied that he did intentionally fail to complete. So that the contractor may even have to refund sums already paid. Nevertheless, some contracts have clauses protecting the contractor on all these scores; or providing for revision by an arbitrator, in any circumstances but those of intentional breach or abandonment.

If payment is provided for as in a lump sum, the contractor who breaks his contract cannot recover any payment; but, where payment by instalments is stipulated, he is to be credited with the value of work done by him before the breach. He would, ultimately, be made to lose to the extent of the extra cost of completion by another contract or of the work as contracted for by him; and if the employer completes at a saving, the contractor does not benefit by the difference resulting from the saving.

Further, if the work is useless to the employer by reason of the breach—for example, the case where stands to view a procession are not ready for use on the day—the employer can claim compensation from the contractor for his losses caused thereby.

Substitution.

The substitution of other materials, even if they be of a more expensive or valuable kind, is breach.

Suspension of Work by the Contractor.

A clause is often inserted giving the employer or his agent power to take possession, and formally eject the contractor, if the latter takes away his employees and fails to continue operations for an unreasonable time. If this clause is acted upon, the employer has a lien on all material and plant on the site, for the use of another person employed by him to complete.

Where the employer delays the work, either by failure to hand over the site punctually, or by interference during progress or failure to supply materials to be supplied by him, it would appear the best policy, on the side of the contractor, to complete with due diligence; and, in case of dispute, to rely on the fairness of the Court to relieve him from penalties or other liabilities for delay.

Or if, in his opinion, the employer is guilty of a breach, or partial breach, he may notify the latter that he considers it a partial breach, then continue to completion, and set this up as an excuse in case of dispute.

In fact, a rule found useful elsewhere is a good one—namely, "Comply first—complain after"; but it must be applied honestly, and with the obvious intention of fulfilling the terms of the contract.

For instance, in a case where a site for road works was to be handed over during the summer, and the employer failed to comply till the winter, the contractor successfully pleaded for a *quantum meruit* payment; or, in lieu, for excess of cost of such work in the winter weather and short daylight, as above and beyond the cost for the same work in the long summer days.

Specific Performance.

It is a general custom of the Courts to grant *damages* for incomplete performance, unless the contract is for a matter which the Court can itself supervise in operation. So that, as a rule, incomplete performance of a building contract (unless it is some simple matter such as the erection of a fence or gate, or some matter not required to satisfy the minutiæ of a specification) is met by damages for the loss incurred by the aggrieved. That is to say, the Court will not undertake technical or skilled supervision.

If the general contractor becomes liable to any sub-contractor for damages, due to the action of the employer, the employer must reimburse the general contractor.

It is the duty of the architect to give notice to the employer, at once, of any breach or undue delay by the contractor.

If the contractor becomes a bankrupt, it is his duty to disclose all contracts to the trustee in bankruptcy. This official may elect to complete any contract; but if he delays unreasonably, the employer may consider the contract broken and take possession, employing another person to use the materials and plant for the completion of the work.

With this in view, it is usually prudent to make, by payment included in progress certificates, all material on the site the property of the employer, so as to avoid dispute with the trustee in bankruptcy as to the value of any loose stuff, or his intrusion on the site. Everything is then the property of the employer except the plant, which he will return in due course when he has used it for its assigned purpose.

BUILDING INDUSTRY COMMITTEE

In pursuance of undertakings given when the Housing (Financial Provisions) Act of 1924 was before the House of Commons, the Minister of Health has taken steps to appoint committees of the building industry and of the manufacturers and suppliers of building materials to advise and assist him in carrying out the scheme embodied in the Act, particularly as regards the development and co-ordination of the supply of labour and materials for house building. The Building Industry Committee has been constituted as follows:

Representatives nominated by employers in the building industry: Messrs. A. Andrews, J. H. Barker, J. Carse, J. Clark, J. P. Cox, C. E. France, A. J. Forsdike, J. C. Gilchrist, F. G. Hodges, H. T. Holloway, E. W. King, H. Matthews, A. Melville, Wm. H. Nicholls, H. R. Selley, J. Somerville, E. J. Strange, A. G. White.

Representatives nominated by operatives: Messrs. T. Barron, G. Haines, H. M'Pherson, D. Merson, S. Sigsworth, G. Waddall, W. Turner, S. Taylor, A. G. Cameron, G. Hicks, W. Coles, R. Wilson, J. F. Armour, W. Cross, R. Coppock.

It is contemplated that representatives of the manufacturers and suppliers of building materials shall be added to this Committee. A separate committee representative of t facturers and suppliers of building m in process of formation, and provisio made for co-ordinating the committees of a small joint committee.

THE COST AND SPE OF BUILDING

In our issue for October 10 we gave u heading an abstract of a paper by Mr. Bromley, F.R.I.B.A., on "Slow an Building."

In the discussion that followed Mr. W of the Bricklayers' Society, said he h known any limitation of output, but exist it was due solely to a fear of u ment. He ascribed the high cost of mainly to the existence of combines, mitted that if they could give the wo guarantee of continuous employmen would be no danger of slowing down. years' time he predicted there would be rence of bad trade in the building indus

Mr. A. V. Guy, referring to the que apprenticeship, made a complaint of th nacy of the Nottingham builders, who that the wages fixed for apprentices w high and could not be induced to take Recently it was estimated that there shortage of something like 300 apprentice building trade in Nottingham alone. M suggested that the profits made by the em should be shown, and expressed a desir some guarantee of regular employment be given to the operatives.

Mr. H. G. Watkins touched upon the d ties of organisation in the building trad referred to trade union regulations with to masonry.

Mr. Bromley, in the course of his repl he sympathised with the operatives question of unemployment, but claime slowing down on the part of the operati the very thing that produced unemploym

A hearty vote of thanks was passed Bromley at the conclusion of the proceed

FLETTON BRICKWOR

A visit of inspection was recently m the Fletton works of the London Brick Forders, Ltd., by a body of the Royal I of British Architects. Under the guid Mr. W. Vernon Crompton, the chairman Science Committee, the members unc the journey to Peterborough, and m thorough inspection of some of the con works. Arriving in the morning, the were taken to the large pit which produ clay for the "Phorpres" Fletton brick then visited the group of works fed by and witnessed the distribution of th The machine shops were then visited, wh grinding, screening, and distribution clay were inspected. After passing thro perforated plates of the grinding pans t is elevated to a series of electrically-v plate screens, and then conveyed by spira distributors to the various machine actual manufacture of the brick is d means of a single unit press, which int four distinct pressures. On leaving th the bricks are taken on transfer cars continuous kilns, where they remain fo 14 to 16 days during the process of burning and cooling.

After lunch the party proceeded company's Crown Works, where the operated by electricity, and very large qu machines are employed for pressing the Here, in comparison to the larger pit, the is entirely carried out by hand owing great depth of the clay. After a visit New Peterborough section, the party co their trip with a visit to Peterborough Ca and after an expression of thanks to the Brick Co. & Forders, Ltd., returned to l

IONAL FEDERATION OF HOUSE BUILDERS.

-yearly conference of the National of House Builders was held re- e Town Hall at Leamington, under ncy of Mr. H. R. Selley.

OR (MR. G. W. HAWKINS), in wel- delegates, spoke of the difficulty in abour, and said if they insisted in de the building of houses would be l innocent people would suffer.

EY assured the Mayor that the re not the masters of the situation. the vehicles by which the cost was to those who needed the houses. f the Federation knew the stand- e workers because they themselves e tools, and had risen to the posi- loyers. What was wanted was a spirit and a little less organisation. will to do which was wanted, and er what they were going to get for He would suggest to municipalities the ways by which they could housing shortage was by en- rtisans to purchase their own dwel-

esidential address Mr. Selley pro- olution advocating the adoption of cy by all building trades employers stion of wages and conditions of said as long as there was shortage industries of bricklayers and plas- would be in the throes of continued increases of wages. They had to send their rance, Belgium, and Germany to o carry on housing. It seemed it was a fact. They were de- he Peterborough and Bedfordshire ir bricks. He believed there they to give them output, but the out- ally inadequate for the demands. like the idea of money going it could advantageously be spent nd at the same time they were and high rates and taxes.

DARBYSHIRE, of Manchester (vice- econded, and said if they did not ey would be used as a lever by es to impose upon the industry o onerous to bear. It was quite our to strive for a more effective the necessities of life, but neither operatives should enjoy better t the expense of the community. d nothing but trouble since trade ame permeated with Communists, to make of it an organised men were to be paid regardless lity or worth, there was no in- a man to do his best, and the be dead level mediocrity. These find a more fertile field for their road in lifting the standard of evel of this country, which would ood of all. "We are as desirous ng the standard as the operative," rbyshire, "but it cannot be done n with low wages abroad." The wished to create the principle that duty of the State to house the there was a very general feeling al workers that they ought to be other means than their own in- rts with housing accommodation at a figure lower than an economic rent. In advancing this claim they quoted the wage of the householder and not the family income which in many cases was a high one. They opposed the decontrol of houses on becoming vacant, because in this they could see that in a few years it would make for an easy stage to total de-control and an end of the Rents Restriction Act.

The resolution was carried.

MR. NORMAN MCKELLEN, the secretary, speaking on local authorities and housing assistance, said, although there were 300,000 less men in the trade, and a great shortage of materials as compared with pre-war days, they were attempting to build 145,000 houses a year, when the greatest number of houses built in any one year before the war was about 130,000. It was an impossible position, and yet the new Housing Act contemplated a speeding of the houses to be built by local authorities. The thing could not be done on the lines which the Government were trying to follow. The country wanted houses for the working classes, and it was not getting them. If the Government would build good-class cottages in rows at 20 to the acre, they would get many more houses with the same labour and for the same money.

At the concluding session of the conference MR. H. R. SELLEY stated that any substituted material put upon the market up to the present time which had been as efficient as brick in house construction, with slate or tile roof, had been equally costly. But he attached importance to the consideration of new methods, having regard to the shortage of skilled labour in the industry and the scarcity of building materials. In order to solve the housing problem, he said, an effort must be made to cut down costs and save labour.

Allusion was made during the discussion to the new material discovered by Commander Burney, and Mr. Selley described it as the nearest approach that he had seen to a practical proposition. He did not wish to give the principle away, but it was one that commended itself to him. It fulfilled all the conditions of outside resistance to weather; it got over the difficulty of what had been referred to as condensation inside, and it reduced the call upon the bricklayer and the plasterer.

MR. JONES, of Liverpool, speaking of alternative methods, said that the wooden house, if it could be fitted electrically, was a perfect proposition, rendering brick flues and other expensive forms of equipment unnecessary.

MR. R. A. COSTAIN, of Liverpool, who introduced the subject of the alternative methods of house building, said the shortage of skilled men in certain branches of the building industry and the lack of materials were reasons which necessitated the consideration of alternative methods. He referred to various systems, and said while he was interested by the scheme proposed by Lord Weir, he would be surprised if it proved suitable for housing. That of building with concrete cellular blocks had much to commend it; and the duo-slab system had worked fairly well. But he thought, with the materials at present available, they could not hope to produce a house at a less cost than that of a corresponding brick house. He understood that Commander Burney had succeeded in discovering an entirely new material. Members of their federation would be among the first to take advantage of any improvement that might result from such an invention or discovery, because all the improvements in the housing of the people had been made by members of their industry, who had been alive to their value at the earliest possible moment. If they could increase the proportion of unskilled labour in erecting the walls of a house they would have done something towards solving the problem in regard to housing. While they endeavoured to secure the maximum number of houses by rapid construction, the houses must provide a reasonable standard of comfort and convenience, and be immune against rapid deterioration. They must avoid unreasonable demands from workers in the building trade, from the manufacturers of materials, and from builders, if there were any, who sought to secure an unreasonable profit. Mr. Costain also emphasised the importance of members of the federation training as many workmen as they possibly could in the branches of the industry which were not sufficiently supplied with workers.

THE PRESIDENT, in conclusion, said what they had got to do was to keep down the cost of building and save labour as much as possible. He hoped that they would be able to get the housing question away from "political doggery." They wanted to bring it back to an economic proposition, and help the Government to provide wholesome houses wherein to house the people.

CONCRETE HOUSES AT BIRMINGHAM

THE members of the Birmingham Corporation made their annual tour last week of the various housing schemes. The Town-Planning and Public Works Committee has in two and a-half years completed 3,710 houses, with running contracts for 4,246 more, and has acquired and is developing sites for a further 6,477, making a total provision for 14,433 houses. Since April this year 1,010 houses have been completed. Over 3,000 of the houses are of concrete. The building in concrete blocks was decided upon because they permit of the employment of a large amount of unskilled labour, and another advantage is that the bulk of the material required can as a rule be obtained on the site, whilst the time occupied in erection is generally rather less than that taken in the construction of a brick house. Variations introduced in the stucco exteriors give a more pleasing aspect than the more severe and monotonous lines of the average dwellings. Even in the non-parlour type of house, bathrooms, with the necessary hot water supply, are installed, and electric light is being adopted for all the municipal housing schemes. Concrete houses are being built in Birmingham as under: Billesley Farm Estate, 1,500 non-parlour type; Stockfield House Estate, 261 non-parlour, 209 parlour; Gipsy-lane Estate, Erdington, 287 non-parlour; Witton Lodge Farm Estate, 1,000 non-parlour.

The method of construction at Billesley consists of the use of special hollow angle blocks filled solid and reinforced. The spaces between the angle blocks are filled with 2 in. slabs with 3 in. cavities, bonded together by means of bonding iron. At Gipsy-lane the system consists of two thicknesses of concrete slabs with 3 in. cavities, the slabs being dovetailed into hollow headers. The outside is left with the natural face. The system adopted at Witton Lodge Farm comprises the erection of pre-cast concrete stanchions at the angles and at distances of about 3 ft. in the building, the intervening spaces being filled with two 3 in. slabs with 2 in. cavities. Reinforced concrete lintels are run round the building at the first-floor and wall-plate levels.

The New Housing Law.

We have received from the Garden Cities and Town-Planning Association a leaflet giving a summary and explanation of the Housing Act of 1924. There are two Housing Acts in operation at the present time, and it is necessary that a clear and precise statement should be available for all who are engaged in or interested in the housing problem. The leaflet aims at meeting this need. Copies can be supplied at 2d. each, or 1s. 6d. per dozen.

SPECIFIC PERFORMANCE: NON-DISCLOSURE OF UNUSUAL COVENANT

A POINT of some importance to purchasers of leasehold property has been decided in the recent case, Allen *v.* Smith (1924, 2 Ch., 308). The plaintiff was a builder and the defendant was a married woman whose husband was a motor driver, and the defendant and her husband, in 1923, were negotiating with the plaintiff for the purchase of a newly-erected dwelling-house, the lease to be for 99 years at a ground rent of 6 guineas per annum, and a premium of £527 10s. was also payable. On September 1, 1923, the defendant paid a deposit of £10, and she informed the plaintiff that she was anxious to obtain possession and she could find £327 10s. towards the premium, and proposed to apply to a benefit society to advance the balance in order to complete the purchase. The plaintiff informed her she could go into immediate possession if she could pay the sum of £327 10s., and on September 4 the defendant attended at the plaintiff's office with this sum in notes, when the plaintiff's manager produced a contract for her to sign, which contained a clause that the lease should be prepared in the form required by the plaintiff's solicitors and should be in the form in use on the estate of which the dwelling-house formed a part. The defendant read over this contract and asked for a copy of the lease, but was told by the plaintiff's manager that he had not got one with him for her to see, but it was quite in the ordinary form, and if there was anything in it to which her solicitor could not agree she would not be compelled to complete the purchase. The defendant signed the contract and took possession of the house on September 13.

Shortly after this a draft lease prepared by the plaintiff's solicitors was submitted to the defendant, and it was found to contain the following covenant by the lessee: "And also will pay all costs, charges and expenses (including solicitor's costs and surveyor's fees) incurred by the lessor for the purpose of or incidental to the preparation and service of a notice under Section 14 of the Conveyancing Act, 1881, requiring the lessee to remedy a breach of any of the covenants on the part of the lessee herein contained, notwithstanding forfeiture for such breach shall be avoided otherwise than by relief granted by the Court."

This covenant was objected to by the defendant's solicitor, and struck out, but was insisted upon by the plaintiff, who asserted that it was an ordinary and usual covenant and not oppressive, and he claimed specific performance of the agreement of September 4. The defendant, by her defence, pleaded that she was ready to pay the balance of the purchase-money and to complete if the covenant objected to was omitted. The building society had declined to make any advance on the security of a lease containing such a covenant.

The plaintiff denied that any representation had been made by him or on his behalf, that the lease was in the ordinary form and contained nothing unusual. The court held that the substance of the action was whether the covenant in question was one of a nature to impose upon the vendor the obligation of disclosing its existence, or was of such a character that the purchaser could not object to it as being in the ordinary form and containing nothing unusual or extraordinary, and came to the conclusion that, in deciding whether a covenant is an ordinary one or an unusual one, regard must be had to the nature of the leasehold affected. In the case of a property likely to call for considerable repairs and held for a comparatively short term, for instance, such a clause as that inserted into this agreement might be regarded as a reasonable one, but it would be different when a new house is let for a term of 99 years at a moderate ground rent, the chief concern of the landlord in such a case being to see that the ground rent is adequately secured and his adjoining property not injured in value by the house falling into a condition likely to effect this. In the latter case, the covenant in question would be an onerous covenant to which the purchaser's attention ought to be called by the vendor.

The action for specific performance therefore failed, and the defendant succeeded on her counterclaim for repayment of the £327 10s. with interest at 4 per cent., she submitting to pay a reasonable sum for occupation rent for the period she had been in possession.

This case raises an interesting point as on certain estates within our knowledge it has been the custom to grant building leases for 999 years at a ground rent which, as the estate has developed, has been gradually increased, and in these leases there are covenants which would only be appropriate to leases of houses let on quite short terms, but which under the leases apply to the houses erected by the purchasers and, of course, are applicable for the whole term of 999 years. Unless the terms of these leases have been disclosed to the purchasers beforehand, the present case would appear to show that specific performance could not be obtained upon the preliminary contract, for on a term of 999 years covenants only suitable to short term leases would almost certainly be held to be onerous and unreasonable.

INDUSTRIAL EXHIBITIONS

THE following Industrial Exhibitions will take place in the near future:—Portsmouth Industrial Trades Fair (Fifth)—November. Organised by the Manufacturers' Association, Royal Insurance Buildings, Town Hall-square, Portsmouth. Newport Ideal Homes and General Trades Exhibition—October 23–November 1. Messrs. Hamiltons, Ltd., Granville Chambers, Bury-street, London, W.C.1. Ipswich Ideal Homes and General Trades Exhibition—December 3–13. Messrs. Hamiltons, Ltd., London, W.C.1. Warrington Industrial Trade Exhibition (Second Annual)—Empire Hall, February 11–21, 1925. Organiser, Mr. L. Batley, Gorsey Works, Stockport.

Lyons Fair, March, 1925—Apply to Hotel de Ville, Lyon. International Exhibition of Modern Decorative and Industrial Arts, April to October, 1925—Apply to Commissariat général, Grand-Palais, Porte C, Paris (8e). Commercial and Industrial Exhibition, Champ de Mars, Nantes, May–October—Apply to Chambre de Commerce, Nantes. Commercial Organisation Exhibition, Paris, October 9–19—Apply to Mr. G. Ravisse, 7, Rue des Grands-Degrés, Paris (5e). Domestic Appliances Exhibition, Paris, October 21–November 9—Apply to Office National des Recherches et Inventions, 52, Rue de Bellechasse, Paris (7e).

NEW INVENTION

NEW SYSTEM OF BUILDING.

MR. W. E. BAKER, of 13, Francis-road, Upper Parkestone, Dorset, sends us some particulars of a new building process which he has invented and which he puts forward as yet another means by which the housing shortage might be overtaken.

The system consists of a wooden framework on concrete foundations, with slabs of a special composition fitted between the same. The slabs are then coated with coarse cement outside, finished roughcast or smooth stucco as desired, and inside with rough plaster finished with smooth damp-proof plaster.

The inventor naturally does not divulge the constituents of the composition slabs, but he indicates that their cost is no more than half that of cement and that they can be manufactured on the job, to be damp-proof and non-sweating, the two faults between which it has been found so difficult to strike a just balance in ordinary cement concrete slab work.

The feeling that more houses will follow cheaper houses, and that cheaper building implies more drastic revolution in method, probably in the direction of the u units than the traditional brick, some financier to examine this me more closely. His verdict will lar upon the nature of the special comp upon whether its component parts obtainable and sound when made

Recognising the importance of the building methods, we are glad to gi tunity to those who believe they h at a solution. There is no need to r experiments on the slightest prete well to neglect no chance of coming a problem that daily becomes mo acute.

al Commission found that this
evolutionary tendency charac-
rge cities, whether ancient or modern, in Europe and the United States of America. The final stage could be expedited by directive efforts and discreet town planning.

When it had decided the kind of London it was going to try to mould, the new Committee would naturally take up the question of what new streets and street improvements would best conduce to that end, and would most conveniently meet the needs of a community so distributed.

The stress on all sides of financial stringency made it imperative to examine whether any cheaper alternative existed to the construction of new, or the widening of existing streets, in districts where additional street accommodation was required. It might well be that heroic methods were justified, indeed overdue. Lord Montagu with his characteristic bold foresight, proposed in *The Times* of August 21, 1924, the construction of "double-deck" streets. He, personally, thought they would be driven to that expedient, and at no distant date. If streets could not be extended laterally, they must be extended upwards. Surely to see "London walking on stilts," would be preferable to seeing London unable to walk at all. The steady increase of vehicular traffic indicated that this latter condition was no mere morbid apprehension. The Royal Commission, advised by distinguished engineers, considered that "two-story" streets were practicable, but forbore to recommend them as it desired not to detract from the eminent desirability of the new streets and street improvements, which it did recommend, being constructed on the surface.

With reference to bridges, the time had come when not merely the demands of cross-river street traffic, but the structural condition of some bridges, made immediately imperative the consideration of the whole question of London's bridges across the Thames. No one could deny that London enjoyed a smaller measure of bridge facilities for cross-river street traffic than Paris, Berlin or Vienna. The distance between Blackfriars Bridge and Waterloo Bridge was 960 yards; between the latter bridge and Westminster Bridge, 1,063 yards; and between Westminster Bridge and Vauxhall Bridge, 1,699 yards. The reconstruction of Lambeth Bridge would reduce this last gap. But across the River Seine and serving the central districts of Paris, there were, in a length of river of about 3,800 yards, or almost the same distance as between Blackfriars and Vauxhall Bridges, no less than twelve bridges, with an average distance between them of 345 yards, the maximum distance being about 492 yards. In Vienna there were in a length of about 5,740 yards eight bridges across the Danube Canal, which intersected the city, the average distance between them being 819 yards. In Berlin there were twenty-six bridges across the River Spree in a length of 10,936 yards, the average distance between them being 437 yards. Not only was there an insufficiency of bridges in the central area of London, but certain of the bridges did not point in the right direction for important streams of traffic. Notably was this the case on the Middlesex side between Westminster Bridge and Blackfriars Bridge. And other important bridges, *e.g.*, Chelsea, Albert and Hammersmith, were subject to weight restrictions.

If the new Committee could induce the London County Council and the Corporation of London to appoint a Joint Committee to go into the whole question of cross-river street traffic, and report to the new Committee their recommendations, it would be a good beginning of a great public work. No true lover of London had yet lost heart that along her ancient highway, the Thames, there might again be established a service of passenger carrying vessels. When one saw the services maintained on the Seine at Paris, it was hard to accept past experiences as conclusive that such services could not pay in London.

TRADE NEWS

The National Boiler and General Insurance Co., of Manchester, has recently issued a pamphlet, entitled "Heating Boilers." It contains a series of notes on boilers and installations for heating buildings and for hot-water supply. The price of the pamphlet is 1s. 6d.

We have received from Messrs. John Wright & Co. a pamphlet entitled "Warming Large Buildings." The heating of large interiors efficiently and economically is a problem that has for a long time called for a scientific solution. Messrs. John Wright & Co., Essex Works, Aston, Birmingham, claim to have solved this problem scientifically by the St. Andrew gas-heated steam radiator. Each radiator is self-contained, needing only a gas supply connection, and is fitted with a patent automatic valve. The function of this mechanism is to regulate the heat automatically by means of steam pressure, so that the room is kept at an even temperature whatever the fluctuations of temperature outside; this control is effected by actually cutting down or increasing the gas supply, and thus a great saving in fuel is attained. Copies of this pamphlet can be had on application to Messrs. John Wright & Co. (Dept. S.C.).

Messrs. Parker, Winder & Achurch, of Birmingham, inform us they are frequently asked to supply galvanised door and window fittings. But they state that galvanised fittings, while fulfilling the purpose, do not add to the æsthetic appearance. They have, therefore, put upon the market Parwinac Rustless Finish, containing chemicals which enable them to guarantee any fittings thus coated to be permanently rustproof. While they find it impossible to give "art black" finish, Parwinac is stated to be less obtrusive than japanning, and borders upon "egg shell" black. It has a smooth-like surface which, they claim, is easily cleaned down and takes an excellent polish. The Parwinac Finish can be applied to interior and exterior fittings, and adds to the efficiency and durability of door and window fittings generally. The objection to brass fittings has, of course, been the cost; and iron fittings, although coated, have been prone to rust. It can, therefore, be fairly claimed that Parwinac Rustless Finish has a just claim to recognition. The extra cost involved on casement fastenings and stays is inconsiderable compared with the advantage gained. Parwinac Rustless Finish can only be obtained from Messrs. Parker, Winder & Achurch, Ltd., Birmingham.

We had an opportunity last week of seeing a demonstration of a new solvent for removing paint, called "Klenostrip," which has been put on the market by the British & Colonial Chemical Co., Ltd., of 6, Smith-street, Chelsea, S.W.3. The method of using this solvent is first to wash over the old paint with water, apply the solvent (which is of the consistency of thick paste) with a fibre brush, and then remove the paint by scraping or washing it off. It takes about five hours for the solvent to act on the paint sufficiently to soften it so that it can be easily removed with a brush, and although it commences to soften the paint as soon as applied its action gets stronger after it has been applied for an hour or two. It is recommended that the work of the painters be so arranged that the solvent can be left in position for five hours before it is removed, so as to avoid wasting time waiting for it to act sufficiently or having to scrape unduly hard because it has not been applied long enough. The solvent has no smell, and does not affect or discolour the hands. The test took place at a house in Westminster which had apparently not been decorated for many years, and here it was seen that the solvent made it an easy matter to remove several old coats of paint, afterwards varnished.

NEW BUILDINGS IN LONDON

Euston-road.—BUILDING.—New headquarters for the Society of Friends, Endsleigh-gardens, Euston-road. The contract for this building has now been placed with Messrs. Grace & Marsh, of Croydon, and the work is proceeding with a view to completion by Easter, 1926. The exterior brickwork will be in Luton grey bricks with Portland stone dressings, the latter supplied by the Bath and Portland Stone Firms, Ltd. The steelwork is by Messrs. Dorman, Long & Co. Mr. Hubert Lidbitter, of 12, Norfolk-street, Strand, is the architect; and the quantities were prepared by Mr. Arthur Boxall.

Wood-street.—FLATS.—A block of residential flats is to be built on a site of 5,450 square ft., in Wood-street, Westminster, S.W. 1. The plans show a building of six stories on a frontage of 40 ft. Brick construction is proposed with stone dressings to relieve the principal elevation. The floors will be of concrete (reinforced), and steel will be introduced to carry all loads. The roof will be flat, of concrete, with an outer coating of asphalte. The flats will be of varying sizes, consisting of four, five, and six rooms. The architect is Mr. Matthew Dawson, 9, New-square, Lincoln's-inn, W.C. 2.

Haymarket.—THEATRE.—The site in Haymarket, known as Nos. 62-65, is being excavated, and existing foundations removed, in order to make way for the new "Carlton" Theatre. The building will be built on a steel framework with cantilever balconies and an exterior façade of Portland stone. The total number of seats to be provided will be 1,200; whilst considerable space will be devoted to lounges, refreshment rooms, &c. The total cost of the building is estimated at £160,000. The site has an area of 12,170 ft., with a rear frontage to St. Alban's-place. The architect is Mr. Frank T. Verity, F.R.I.B.A., 7, Sackville-street, W. 1., acting on the instructions of the Carlton Theatre Co., Ltd., of Austin Friars, E.C. 2. The excavation work is being carried out by Messrs. H. J. Greenham, Ltd., of Fulham and Isleworth.

Fleet-street.—OFFICES.—New premises for use as headquarters for their various publications are to be erected by Messrs. Benn Bros., Ltd., the publishers, of 8, Bouverie-street, E.C. 4. A portion of Fleet-street, comprising Nos. 154, 155, 156, 157, 158, 159, and 160, extending over a frontage of about 75 ft., from St. Dunstan's-court to Bolt-court, has been acquired. A seven-story building of steel frame construction, with a frontage of Portland stone, is proposed. The entire construction will be fireproof, and all the floors will be reinforced concrete. Steel windows will be installed. The premises will have a ground floor area of 12,000 square ft., reaching to Gough-square in the rear. The architects are Messrs. Campbell Jones, Son & Smithers, 9, Dowgate-hill, Cannon-street, London, E.C. 4. The demolition work and clearance of the site is being carried out by Messrs. B. Goodman, 33, Haggerston-road, E.8.

Gresham-street. — WAREHOUSE. — The steelwork is now nearly all in position on the large warehouse and office building, on the site of 47-57, Gresham-street and 22-26, Wood-street, E.C. 2. The site covers an area of about 15,000 square ft., and has a frontage of 220 ft. The area totals about 67,000 square ft. Portland stone is being used for the elevations, with a mansard roof of slates. The building will be supported on a steel framework, with hollow tile fireproof floors. The architects are Messrs. Richardson & Gill, FF.R.I.B.A., of 41, Russell-square, W. 1, acting on the instructions of the London and Northern Estates, Ltd. The consulting engineer is Mr. Adrian Collins, M.Inst.C.E., of 61, Old Broad-street, E.C. 2. The general contractors are Messrs. W. H. Lorden & Son, Ltd., 107, Trinity-road, Wandsworth, S.W. 17, whilst the following subcontracts have been placed: Steelwork, Messrs. Dorman, Long & Co., Ltd., 4, Central Buildings, Westminster, S.W. 1; steel windows, Messrs. The Crittall Manufacturing Co., Ltd., 246, High Holborn, W.C. 1; heating installation, Messrs. F. A. Norris & Dutton, Ltd., 11, St. Andrews-hill, E.C. 4; sprinklers, Messrs. The Vigilant Sprinklers, Ltd.; lifts, Messrs. The Express Lift Co., Ltd., Greycourt-street Works, S.W. 1; artesian wells, Messrs. Alfred Williams & Son, 14, Victoria-street, S.W. 1.

Regent-street.—CINEMA.—Foundation work is being carried out on the site of the old New Gallery Kinema, in Regent-street, W. 1, owned by the Provincial Cinematograph Theatres, Ltd., 189, Piccadilly, W. 1., which is being rebuilt. The elevation of the building will be carried out in Portland stone. Marble and fibrous plaster work, richly gilded, will be used for decorating the interior of the theatre. The architects for the work are Messrs. Nicholas & Dixon-Spain, 14, Hanover-square, W. 1; whilst the quantity surveyor is Mr. H. J. Venning, 5, Bedford-row, W.C. 1. The contractors for the first section of the reconstruction are Messrs. Bovis, Ltd., 43, Upper Berkeley-street, W. 1; and for the second section, Messrs. William Downs, Ltd., Hampton-street, Walworth, S.E. 17

Bouverie-street.—OFFICES.—The *Daily News* and *Star*, Ltd., of Bouverie-street, E.C. 4, are erecting a large manufacturing works as an extension to their present premises at the corner of Bouverie-street and Tudor-street, E.C. 4. It is proposed to build premises with a large basement for housing the heavy printing press, and with four floors above for lighter plant, and for offices, storage, &c. Plans have been prepared by Mr. Marcus Evelyn Collins, F.R.I.B.A., of 61, Old Broad-street, E.C. 2; whilst the consulting engineers for the steel work and civil engineering are Sir Douglas Fox and Partners, of 38, Bedford-place, W.C. 1. The general contractors are Messrs. Trollope & Colls, Ltd., of 5, Coleman-street, E.C. 2; and excavation work is now in progress.

Merton.—HALL.—A new hall is to be built on a site in Merton High-street, S.W. 19, by the Temperance Billiard Halls, Ltd., of 638, Wandsworth Bridge-road, London, S.W. 8. The new building will be of concrete block construction, with a pitched roof, covered with slates. Plans have been prepared by Mr. S. B. Pritlove, 38, Great Windmill-street, W. 1; whilst the work on the site is being carried out by the company's own building staff.

Wood-street. — TELEPHONE EXCHANGE. — Plans are in preparation by H.M. Office of Works, at Storey's-gate, S.W. 1., for the new building. The work on the site is being carried out by Messrs. John Mowlem & Co., Ltd., of Ebury Bridge-road, S.W. 1.

Woolwich. — HOSPITAL. — Work has just started on the contract for the erection of the first section of Woolwich's large War Memorial Hospital. The entire cost is estimated at about £200,000, of which £100,000 has been collected. The architect is Mr. W. A. Pite, F.R.I.B.A., of Pite, Son & Fairweather, 12, Cartaret-street, Westminster, S.W. 1; the consulting engineer is Mr. J. T. R. Kiernan, B.Sc., A.M.Inst.C.E., 17, Victoria-street, S.W. 1; and Mr. W. J. Falkner, 12, Cartaret-street, S.W. 1, is the quantity surveyor. The general contractors are Messrs. Foster & Dicksee, Ltd., of Manresa-road, S.W. 1., and Rugby.

Chelsea.—HOTEL.—The "Queen's Head" Hotel, at 27, Tryon-street, Chelsea, S.W. 3, is to be rebuilt at a cost of about £10,000. The building will be erected in Doulton stone, with a roof of red tiles, floors of fireproof construction covered with composition. Heating and electric lighting systems will be installed. The window casements will be of steel, with leaded lights. All the interior joinery will be of oak. Plans have been prepared by Mr. S. G. Newnham, surveyor to Messrs. Barclay, Perkins & Co., Ltd., the brewers, of Park-street, Southwark, S.E. 1; whilst the general contractors are Messrs. White & Johnson, of 27, College-place, Chelsea, S.W. 3.

Cockspur-street.—EXTENSIONS.—Lar
sions are to be carried out to the offices
spur-street, S.W. 1, of the Royal M
Packet Company, of Royal Mail Hou
gate, E.C. 2. It is proposed to e
a building of five stories and basement,
a ground area of 5,800 ft. The structu
supported on a steel framework with a
of Portland stone. Floors will be of
construction, and the roof will be
covered with asphalte. High-class
joinery and fittings will be installed,
window casements will also be of woo
pressure hot-water system, electric
a passenger lift will be installed. P
been prepared by Messrs. Grace &
of 3, Wardrobe-place, E.C. 4. The
contractors are Messrs. Trollope & C
of 5, Coleman-street, E.C. 2; whilst
was cleared by Messrs. B. Goodm
33, Haggerston-road, E. 8.

Little Britain.—HALL.—New quarter
of the City livery companies is to b
on a site in Little Britain, E.C. 1.
building will be five stories in height,
elevation in Portland stone. The acc
tion will include a reception room a
on the ground floor, with a stately
leading to the council chamber on
floor. The upper floors will be used a
Plans have been prepared by Messrs.
T. S. Vickery, of 50, Gresham-street,
the general contractors being Messrs
& Gayford, Ltd., of 87, Worship-street

Regent-street.—CAFÉ ROYAL.—It is e
that work will be put in hand shortly
erection of a further section of the large
projected by the proprietors of the Caf
in Regent-street, W.1. Two further por
the extensive site still remain to be de
and the operations will, it is expected,
well over four years, involving an expen
between £400,000 and £500,000. E
cellarage is contemplated and a sy
ventilation to keep the temperature at a
level is to be installed. Messrs. Trollope
Ltd., 5, Coleman-street, London, E.C.2,
general contractors, whilst the following

(For rates of wages in the Building Trade in Scotland, see page 621.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Paddington Hall and Library.

The Paddington Baths and Washhouses Committee has had a scheme prepared by Mr. Herbert Shepherd, F.R.I.B.A., for the erection of a public hall, a lending library, and shops on the Porchester-road frontage of "The Lodge" site. The scheme provides for a large public hall at the first floor level, with five shops and a lending library on the ground floor. The public hall principal entrance will be in the centre of the main façade fronting upon Porchester-road. This entrance will be at pavement level, through an arcade—with show windows to the shops on each side—leading to the vestibule hall and stairs to the basement and first floor. The hall, which will be some 30 ft. high, 50 ft. wide, and 105 ft. long—exclusive of a semi-circular platform of a depth of about 18 ft.—will accommodate between 800 and 1,000 persons (including standing room), and there will be additional accommodation on the east side in the large lounge recesses overlooking Porchester-road. The lending library at the north end of the site will be about 40 ft. by 21 ft., and has been planned on the open access system, with a portico entrance and vestibule at the north-east angle. The construction of the premises is proposed to be on the principle of a steel-frame structure, with reinforced and fire-resisting floors and walls.

The estimated cost of the scheme is as follows:—Public hall and shops, £59,450; lending library, £5,400; total, £64,850.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

Ware, six bungalows, Wolseley-road, St. Budeaux; J. E. Deans, 14 houses, Belair-road; S. B. Burch, bungalow, Wingfield-road; C. A. Pope, garage, rear of 1, Woodland-terrace; J. E. Deans, four houses, Meredith-road; R. Bate, four houses, West Down-road, Swilly.

PLYMPTON.—The Devon County Architect is to prepare a scheme for the erection of additional rooms at the Council school.

PONTEFRACT.—Plans passed by T.C.: Bungalow, Engine House Farm, for Mr. J. W. Bywater; lock-up shop, Love-lane, for Mr. C. Johnson.

PORTISHEAD.—Plans passed: Bungalow, Bead-road, for Mr. Edwards; house, Nore-road, for Mr. Scott.

PREESALL.—Plans passed: Bungalow at Sandy-lane, for Mr. N. Kirkham. Application is being made by the District Council to the Public Works Loan Board for a loan of £2,000 for housing purposes.

READING.—Plans passed by the Corporation: Theatre, for the Reading Palace (Theatre) of Varieties, Ltd., Cheapside; Catholic Church, for the Bishop of Portsmouth, in Liebenrood-road, Reading; bridge, by Messrs. Sutton & Sons, in Abbey-square; 12 houses proposed to be erected by Messrs. Sheppard, Ryder & Taylor, in Kidmore-road and Uplands-road.

REIGATE.—The T.C.'s Borough Surveyor has been instructed to bring up a scheme for the erection of houses at South Park.

RIPON.—The City Council has adopted a lay-out for the erection of 32 dwellings in Bondgate.

ROCHDALE.—Plans passed by T.C.: Blake Motor Co., eight houses, Yorkshire-street.

ROTHWELL.—Plans passed by U.D.C.: Two houses, Haigh-road, for Ulyett & Greaves; two houses, Haigh-road, for Hanson & Rhodes; house, Ouzewell Green, for Mr. J. Hardwick.

ST. ALBANS.—The R.D.C. has decided to build 28 houses at London Colney. They also decided to build 12 houses at Tyttenhanger Green and 12 at Frogmore. The Council decided to advertise for tenders.

SCARBOROUGH.—The M.H. has sanctioned a loan of £3,000 being raised for the purpose of providing new public conveniences, on the Sandside.

SEGHILL.—The U.D.C. has approved of plans for the erection, by private enterprise, of 90 semi-detached houses on Seghill-road.

SELBY.—It is now proposed to proceed with a scheme for the erection of an elementary school, estimated to cost £14,500.

SHELTON.—The parishioners have taken in hand a big scheme of church restoration and renovation, costing £1,000.

SHIPLEY.—The Surveyor is to prepare plans for a smallpox hospital in brick and rough-cast.—The Surveyor is to prepare schemes for houses on land at Hurst Wood.—The Architect (Mr. Dawson) has prepared plans for a maternity and child welfare centre at the grounds of Somerset House, the cost being estimated at £4,750.—Plans passed: House, Carmona-gardens, for Mr. E. Dawson; two houses and shop, Hurst Wood-road, for Mr. J. Cooper; house, Glen View-road, for Mr. M. Driver.—The U.D.C. are to erect 180 dwellings in the near future. The site on which it is proposed to build the houses is situate on the Albert-road Estate.

SHITLINGTON.—A new school for 450 children is to be provided by the West Riding E.C.

SHREWSBURY.—The T.C. is to discuss with the C.C. the widening of the English Bridge and approaches.—Mr. John Vaughan, builder, Oswestry, who has the contract for 24 houses on the Sultan-road estate, has agreed to erect 46 others at a cost of £16,942.—Sir Chas. Nicholson, architect, has now prepared a scheme for the adaptation of the Castle as a Council Chamber and museum, at a cost of £3,500.

SIDCUP.—The U.D.C. are proposing a town-planning scheme.

SLEAFORD.—The U.D.C. is inviting Mr. W. H. Maxey to act as architect for the first instalment of the Drove-lane housing scheme.

SOLIHULL.—The D.C. has decided to apply to the M.H. for provisional approval to the erection of 150 dwellings, as follows: Solihull, 60; Tanworth, 32; Knowle, Balsall, and Lapworth, 12 each; Packwood, 8; Baddesley Clinton, 6; Barston and Elmdon, 4 each.

SOUTH KIRBY.—West Riding E.C. is purchasing land for a proposed school.

SOWERBY BRIDGE.—Plans passed: Two lock-up shops near County Bridge, for Mr. J. Sykes; mill at Mearsclough, for Mr. H. Spedding; and six houses in Hollins-lane, for Helliwell & Shaw.

STAFFORD.—The R.D.C. recommended that the Surveyor should repair the rock road at Hopton; that the re-surfacing of the Weston-road should be carried out by contract on receipt of the approval of the M.T.—A plan was submitted, showing the suggested improved line in the borough of Silkmore-lane, as approved by the T.C., together with the suggested continuation of this improvement through the area of the rural district, and it was resolved to co-operate with the T.C.—Plans approved: House at Hyde Lee, for Mr. J. Lamb; bungalow, Brocton, for Mrs. J. Wallace; house, Baswich-lane, for Mr. H. Pye.—Plans approved by the T.C.: Mr. G. J. R. Millington, house, Rowley Park; Mr. F. W. Heggs, house, Lichfield-road; Mr. H. W. Machin, house, Doxey; Mr. C. B. Cantrill, four houses, Queensville.

STANFORD-LE-HOPE.—A new R.C. school for 100 children is to be built in Southend-road.

STANLEY (YORKS).—Plans passed: Bungalow Potovens-lane, Outwood, for Mr. J. G. Hoole.

STOKE-ON-TRENT.—Plans passed by T.C.: Two houses, Princes-road, for Messrs. J. Grant, Ltd.; house, Trentham-road, for M. G. Wall; three houses, Lansdowne-road, for Mr. Gibson; assembly hall, Penkville-road, for Boy Scouts Association; house, Star and Garter-lane, for Mr. W. C. Tams.

STOKESLEY.—Plans passed by the R.D.C.: Bungalow, Tame Bridge, Stokesley, for Mr. G. Pagett; bungalow, Rudd's Banks, Yarm, for Mr. F. Dantry; house, Bridge-street, Great Ayton, for Mr. E. N. Hove.

STRETFORD.—The U.D.C. has received the B.E. approval for the erection of Gorse Hill Central School. Application has been made to the M.H. for sanction to a loan of £16,130 to defray the cost.—The M.H. has been asked to sanction the borrowing of the sum of £24,586 for the cost of erecting 50 houses and the construction of road and sewer works on the Seymour-grove housing site.—Preliminary arrangements are to be made in respect to the last instalment of 56 houses on the Seymour-grove site. Plans passed by the U.D.C.: Four houses, Halvis-grove, for Messrs. Halliday & Davies; 10 houses, Avondale-road, for Mr. George A. Russell; six houses, King's-road, for the Artistic Housing Co., Ltd.

SUNDERLAND.—The T.C. has empowered the Borough Engineer to proceed with the erection of 62 houses on the Spark Farm Estate.—Plans were passed for the erection of 40 houses by Mr. M. McGlynn, on a site adjoining Reginald-street, and it was resolved to apply to the M.H. for permission to borrow £4,800 for the necessary grants.

TADCASTER.—Plans passed: Bungalow at Owlett Hall-lane, Kippax, for Mr. Lawton; two houses at Horner-avenue, Scholes, for Mr. J. H. Moss.

THETFORD.—A concrete wall is to be made along the Little Ouse, at a cost of about £1,000.—Plans passed: Bungalow, Norwich-road, for Mr. Large.

TILBURY.—Land in Dock-road has been purchased by the Standing Joint Committee for the erection of police houses.

TYNEMOUTH.—The B.G. has purchased a site near Military-road, for the erection of a receiving home for children.—The T.C. has asked the B.S. to report as to the provision of conveniences at Tynemouth and Cullercoats.—The Electricity Committee proposes the erection of a sub-station.—Plans passed: Semi-detached houses, Kenner's Dene, for Messrs. J. F. Newbold & Co.; eight cottages, Alexandra-road, for Aged Mine Workers' Association; sixteen houses, Hunt Hill Estate, for Mr. J. Carruthers; six houses, Hawkey's Hall Estate, for Mr. G. Leck.

UPPER RENFREWSHIRE.—Plans approved: Double cottage, Roxburgh-circus, Cardonald, for W. M'Lean and C. Cormick; bungalow, Roxburgh-circus, Cardonald, for Mrs. Harper; public shelter and lavatories at Clarkston Toll, for the C.C.; eight terrace houses, Lochiel-terrace, Thornliebank, for the Calico Printers' Association, Ltd.; nine bungalows, Busby-road, Giffnock, for J. & J. Dixon; bungalow, Broadlie-road, Neilston, for J. Turnbull; bungalow, Commercial-road, Barrhead, for A. Logan; cottage, Linwood-avenue, Clarkston, for J. P. Campbell.

UPTON.—West Riding E.C. is to purchase a site at a cost of £924 for a school to accommodate 1,000 children.

WALTHAMSTOW.—Revised plans have now been prepared by the Essex County Architect for a secondary school for boys, with accommodation for 460, and estimated to cost £48,500.

WAYLAND.—The R.D.C. recommend houses as follows: Attleborough 4, Stow Bedon, 2, Watton 4, Rocklands 4, Great Ellingham 2, Old and New Buckenham 4, Banham 2, and Hockham 2.

WELLINGBOROUGH.—The U.D.C. passed plans for two houses in the Drive, four in Roberts-street, two in Melton-road South, and one in Highfield-road.

WEST HARTLEPOOL.—Application is to be made by the T.C. to the M.H. for sanction to borrow the requisite sum for erecting 161 houses on the Raby-road Estate.

WIGAN.—A B.E. inquiry is to be held into the application of the managers of St. John's Church for approval of a scheme for the enlargement of their day schools by the provision of additional accommodation for about 365 children. Application is to be made to the M.H. for a loan to defray the cost of the erection of new baths at Pemberton, in accordance with the plans submitted and approved by the Baths Committee. The question of the erection of a new pavilion in Mesnes Park is under consideration.

WOODFORD.—Plans passed by U.D.C.: Three houses, Woodville-road; two houses, King's-avenue; extension, mission hall, Beechcroft-road; three houses, Snakes-lane; two houses, King's-avenue.

WORTHING.—Plans approved by the T.C.: 24 houses, Ham-road, for A. Clare; four houses, Browning-road, for H. Hill; house, St. Lawrence-avenue, for F. C. Wentworth, by G. J. Norris; nine houses and seven garages, St. Botolph's-road and Tarring-road, for J. F. Collier; 32 houses to front a proposed extension of Leigh-road, for The Broadwater Building Co., Ltd., by H. F. Carmichael; three houses, Highdown-avenue, for J. C. Roberts, by E. J. Love; house, South-street, Tarring, for W. S. Nockolds, by T. R. Hyde; four houses fronting the west side of Shakespeare-road and the south side of Browning-road, for F. H. Butler, by J. E. Lund; house, Rowlands-road, for E. H. Tyler; 10 houses, Browning-road, for W. C. Butler, by J. E. Lund; three houses, St. Wilfred's-road, for Worthing Estates Building Co., by F. G. Abell; house and shop, Broadwater-road, for Miss Webb, by F. Slaughter; two houses, Chesswood-road, for H. Tier & Son, by J. E. Lund; house, Wallace-avenue, for P. Elliott, by J. H. Hockman, Ltd.; garage rear of "Sea Breeze," St. Valerie-road, for G. A. Little; two shops and house, Railway-approach, for H. P. Brazier, by A. P. Brazier; house, Parkfield-road, for J. H. Hayes, by H. M. Potter; house, St. Lawrence-avenue, for H. Harwood.

YORK.—The City Council approved a tender for erection of 300 steel-framed concrete houses at a cost of £139,297 10s., and it was decided to ask permission from the M.H. to borrow £146,262.

Obituary.

occurred recently at the age of 47, Barnhill, of Mr. Robert L. Hardie, f Gauldie & Hardie, architects and undee.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Glasgow.—Various.—The following plans have been lodged with the Dean of Guild Court for approval: Eight houses, at Newlands, for Mr. John C. Lyle (architects, Messrs. Wilson & McGill, of Motherwell); 15 houses, at Crompton-avenue, Cathcart, for Southern Building Co. (architects, Messrs. J. J. Craig & Son, 219, St. Vincent-street); house, at Hatfield-drive, W., for Mr. Wm. B. Inglis, 261, West George-street; six houses on new road between Danes-drive and Northland-drive, for Scotstoun Estate Building Co.

Ayrshire.—Houses.—Plans passed: Five houses, 3 bungalows, and a semi-detached bungalow, all to be erected at West Kilbride; two cottages, at Kilwinning; bungalow, at Stewarton.

Hamilton.—Factory.—A site has been obtained in Almada-street, for the erection of a knitting factory, and plans of a building to accommodate 300 workers have been passed by the Dean of Guild Court.

Stirling.—School.—The Property Committee of the E.C. have received sketch plans from the architect in connection with the proposed school at Riverside, the estimated cost of which, according to the plans submitted, is £40,000. The plans have been forwarded to the Education Department for their observations, and negotiations are taking place regarding the ground with Stirling T.C.

Edinburgh.—Houses, &c.—Plans passed by the Dean of Guild Court: Six-flatted villas, at Willowbrae-avenue, for Thomas Anderson; residence for students of divinity, &c., for the Trustees of the Church of Scotland; bungalow, at Granton-road, for Mrs. Magdalene Wood Dickson, of McKelvie; house, at Ravelston-dykes, for George Roberts; seven bungalows, at Queen's-road, Blackhall, for Thomas Sutherland Henderson; eight houses, at Saughtonhall-avenue, for McKendrick & Co.; three houses, at Templeland-crescent, for Geo. Paterson. The City is to erect 926 houses at Lochend according to plans by the Director of Housing.

Gourock.—Club House.—The Dean of Guild Court has approved of plans for a new club-house of the bungalow type to be erected for the Golf Club.

Stirlingshire. — Additions. — Mr. Malcolm, architect, has submitted sketch plans showing alternately how the new accommodation required at Lennoxtown School could be provided, and the Property Committee of the E.C. of the County of Stirling has recommended that the reconstruction of the school and the additions shown be proceeded with, at an estimated cost of £4,517, and also that the architect be authorised to procure estimates. Mr. Malcolm also submitted plans showing how the accommodation at St. Machan's School could be provided, and the Committee recommended that these alterations and additions should also be proceeded with, at an estimated cost of £2,800. The recommendations were approved on condition that specifications be submitted to the authority before work is commenced.

Perthshire.—School.—The E.C. has sanctioned the erection of a joint school for Caputh and Spitalfield, for the Blairgowrie District Primary Schools Committee. The site will be midway between the two villages.

DOMESTIC WELFARE EXHIBITION

The Domestic Welfare Exhibition opened in the Kelvin Hall, Glasgow, on October 13. Probably the outstanding exhibit of the show is the steel house built by Messrs. Beardmore's, of Dalmuir, for the Duke of Atholl, which was inspected last Saturday by Mr. Wheatley's Advisory Committee. This is a four-roomed bungalow cottage, with scullery, bathroom, &c. The external walls are made of large steel sections, three-eighths of an inch thick, treated on the inner side with a preparation designed to eliminate sweating. The internal walls are composed of asbestos fittings with air spaces between the outer and inner walls. The asbestos walls may be painted or papered like an ordinary plaster wall. A special preparation having all the durable qualities of cement but warmer underfoot is used as flooring material. It can be made in any colour. Coloured tiles or slates are used for the roof. Another interesting exhibit is a full-size "lay-out" of a three-apartment house of steel construction.

The steel house was inspected recently by Miss Ritson, a member of the Scottish Board of Health, Mr. John L. Jack, Director of Housing of the Scottish Board of Health, and Mr. MacNiven, Chief Engineer to the Scottish Board of Health. After inspecting the bungalow, the official visitors expressed themselves as very well pleased with the house. Illustrations of this house, together with a description, are given in this issue.

Greenock War Memorial.

The unveiling took place recently of the Greenock War Memorial. It is of white granite, in the form of an obelisk set on a massive pedestal. At the base of the obelisk is the prow of a Viking ship, on the deck of which is a winged figure of Victory, while near the top of the obelisk a Celtic cross is inlaid in red granite, having on its face a Scottish two-handed sword. Messrs. G. Washington Browne, R.S.A., and Pittendrigh Macgillivray, R.S.A., were advisers to the local committee. The architects were Messrs. Wright & Wylie, and Mr. Alexander Proudfoot, A.R.S.A., was the sculptor.

DING TRADE WAGES IN SCOTLAND.*

ng are the present rates of wages in the building trade in the principal towns of very endeavour is made to ensure accuracy, but we cannot be responsible for errors eur:—

No. 4264. OCTOBER 24 1924.

HOUSES AND POLITICS

NE of the only points on which those interested in housing can agree is that it should not be made a party question, and yet every time we get a general election—a contingency that is becoming distressingly frequent—we find speakers of all parties sing as a catch-cry. They all promise much the ng, they all draw attention to other people's housing nd all swear that they would do great things. There nuous policy that the public knows will be proceeded rdless of which side is in power.

analyse candidly the lines upon which the different n their housing. One party, broadly speaking, con- t housing must be left as far as possible free from nd that private enterprise must be encouraged in . This principle it carries to the length of permitting n of houses which may be and often are below the hat ought to be insisted upon in State-aided schemes. ren allow overcrowding, lack of light, and similar winked at, because by so doing a few more houses ed to the number of those built. This policy is fatal, ilding the wrong kind of house we are perpetuating the that we are supposed to be removing. If we cannot uate houses, we may be driven to build inadequate they must not be permanently inadequate. If, for re could build two temporary houses to last twenty e price of one that would last sixty years, there would ng case for building temporary houses. Again, it is to build houses in two stages, let us say, to roof with corrugated iron, and to slate or tile them at a but it never can be right to build permanent houses ther bad in accommodation, grouping or appear- s is the lesson the party must learn if its housing carry conviction.

no one can find fault with the attitude of another rds the housing standard, yet a programme that ovide houses at the low rental contemplated must to disaster. Such an interference with the natural events throws the whole housing market hope- of gear, creates a privileged class, and places a bility on the country greater than it can bear. A s programme" sounds very nice, but since everyone a future Government can, and probably will, close short notice, the whole benefit of continuity is lost. ontinuity could only be attained if the great parties ed to it and if it were of so practicable a nature blic could pin faith upon its realisation.

using plans of these two parties are completely and they both contain fatal weaknesses. Whether rty would be able to evolve a housing scheme that erection of unsatisfactory houses on the one hand gravation of uneconomic conditions on the other be seen, but continuity in housing progress can ired by steering a middle course—and this is never party undoubtedly realises the urgent necessity illed labour, for in its election manifesto it says: "It has long been obvious that the solution of the housing problem depends mainly on a sufficiency of skilled building labour being made available. Mr. Wheatley's Housing Act professed to deal specifically with this part of the problem. But no effective measures have been taken to train young apprentices or otherwise to increase the number of building craftsmen. Instead of its being possible to say that under the Wheatley Act progress in house building has been made, the fact is that fewer houses are now being begun than when the Government came into office." The policy of this party on housing is to insist that the reserve of unemployed labour should be utilised to build houses for the people.

We must compromise somewhere, and the best compromise would seem to lie in the adoption of devices that would render houses reasonably habitable for the time being, but would not prevent them from being turned into entirely satisfactory houses later on when we can afford it. We might perhaps make a more extended use of corrugated iron, which would, of course, be tarred or painted, as a temporary roofing material, and there are numerous other ways in which cheap and common materials could be used for the time being with a view to their subsequent replacement. But in toying with such a proposal we must keep steadfastly in mind the necessity of ultimately obtaining an entirely satisfactory house. We must not compromise over the sizes of rooms, eliminate bathrooms, or build too many houses to the acre, these unfortunately being the first points that strike some politicians in attempting to deal with the problem.

The use of carefully chosen temporary substitutes may well prove to be the key to our present difficulties, but such materials should be available or easily procurable everywhere, and should make no demand upon skilled labour. The inhabitants of Messina and the neighbourhood had recourse to corrugated iron after the earthquake, and in every part of the world it is found acting as a stop-gap, and often as a permanency in the absence of better material. It is, of course, vulnerable to extremes of temperature, but our climate is singularly free from extremes and a layer of tarred felt under the iron would take the edge off the cold.

Sooner or later everyone will have to face the truth that no party or combination of parties is going to give us adequate houses for the lower paid workers at reasonable rents; and the question, therefore, resolves itself into where to draw the line of inadequacy. If we are to avoid putting up permanently useless houses we must concentrate upon building houses in such a way that they will serve their purpose of relieving families from their present distress and at the same time will not be incapable of improvement in the future.

We shall do well to note the opinion of Major Barnes, the Vice-Chairman of the Committee recently set up by the Government to inquire into new methods of construction and new materials for building, in his article on p. 632: "I cannot help thinking that we have not yet exhausted or nearly approached the exhaustion of the supplies of those well-tested and time-approved materials heretofore classed as building materials."

NOTES.

Standardisation and Unemployment.

EVERY Party and most individuals are turning their attention to devising new materials and methods of building in view of the shortage of labour in the building industry, and standardisation is becoming to be thought the only cure which can be applied to overcome the present shortage of houses. The war affected the building industry as it did so many other industries, causing a heavy toll of men, but since the war there has been time, if there had been the will, to increase the numbers of those engaged in the building trade; the trade unions, however, have set their faces to limiting their numbers instead of augmenting them. Are the trade unions alive to the position they are creating? If new methods designed to save labour can be successfully introduced, do they think these new methods will cease to be employed directly the shortage is made up? Who can tell what will happen? But it seems a serious thing in any industry to create such an artificial shortage of men that labour saving or other methods have to be turned to. Unemployment is rife, and it seems an anomaly that restriction should be put on labour in any trade at such a time, but the restricted and protected industries should look a little beyond the immediate future and have regard to what may lie before them. In old times the operatives engaged in industry opposed even with violence the introduction of machinery, not having sufficiently far-sighted vision to see what the effect of increased output might be in increasing wages and trade, but the trade unions in the building industry are erring in the opposite direction—to secure what they deem necessary at the present time they are actually encouraging methods to be devised which may very well develop until their labour can be dispensed with. It is well that their attention should be called to what may be the ultimate result of their present action.

New Methods.

IT seems odd that a party at an election should adopt "new methods of house building" as one of the main items in an election programme, because one would imagine that everybody, of whatever political creed, would welcome any new method that promised to be successful. In the opinion of many, house construction has been so thoroughly explored in the past that some startling new discovery that will revolutionise the industry lies almost beyond the bounds of possibility. Those who argue thus hold that hard work is our only hope—a depressing thought, but probably a true one, the saddest part being that thousands who would be able and willing to work hard can get nothing to do.

Housing and Employment.

DR. ADDISON, in a speech at Hammersmith, maintained that it was impossible to overcome the housing shortage by private enterprise, and advocated a scheme run on the lines adopted by the Ministry of Munitions when there was a shortage of munitions during the war. That it should be possible for a desperate shortage of houses to exist side by side with a desperate degree of unemployment and dole-giving is an absurdity and argues that something is wrong. What? Is it organisation and co-operation that are lacking, or merely good will? Whatever may be wrong we cannot believe that a repetition of Ministry of Munition methods is likely to set matters right. It seems to be human nature that is at fault, because, while in theory there may be no flaw in Dr. Addison's proposal, in practice unquestionably turn out to b flaw.

Two Cottages at Rudgwick, Sussex.
(Restored by MR. MANNING ROBERTSON, A.R.I.B.A.)

Housing a Local Affair.

THE more one st housing question does one conclud should be a loc Any district that possessed ha men of position, endowed with and determination, who put energy into solving local difficult certainly succeed in doing so; with the help of the State subsi a fearful amount of drive and overcome the obstacles that a every turn—the price of land, t ings of everyone concerned, th of skilled labour and materials, as to the next change in our kal legislation all tend to make the housing enthusiast terribly disa

Every-day Architecture.

WE have receiv culars of an excel of articles by Mr. Robertson, A.R.I. "Every Day Architecture," w appearing in the *Home Reading* (National Home Reading Union Buildings, Adelphi, W.C.). The be six articles and the first has been considered with the interesting the lay reader in arc and we may congratulate magazine and the author of th on their good intentions. It that the lay reader should k some modern architects, too—t essence of architecture lies, no mentation (for an architectural may be, and usually is, simplic but it depends upon the qualiti portion, texture, and colour. satisfactory effects it is first of all that the designer of the buildi be interested and conscientiou work. It is the absence of thi during the nineteenth centu accounts for the lamentable resi do not expect fine and enduring from the man who is commis write thirty columns a month, carries out his task in the spirit through it somehow in order t money; neither can we ex architecture from the builder w care is to 'attract purchase neither the builder nor the know or care anything abo tecture."

Report of the British Institute of Industrial Art.

WE have rece Report of this from 1919 to 19 an account of its the date of its Its object is to the organisation bitions of industrial art and t standard of quality in it, linki with the activities of the a museums, and other institutio with art training. There is a

Cottage at Rudgwick, Sussex, after Restoration.

above illustration and that on p. 626 show two workmen's cottages which have tored by Mr. Manning Robertson, A.R.I.B.A., to form one residence. The builder is Mr. James Marden, of Rudgwick.]

t in regard to its financial s since the withdrawal of a grant. Since that time the has had to depend on public and an appeal is made to place ermanent basis. We have to be hen reading such an account Report gives of the extensive y of organisation which its include, to look at the other he picture. What has been its n "maintaining and raising" ndard of industrial art"? Art y is a difficult thing to encourage ays. Do we not owe improve- her to the direct initiative of e the Underground Railways, e so much improved on past of advertising? There is no t public and professional opinion l to believe most in the slow increased personal responsi- the manufacturer finding an nd profits, on the increased ss of the craftsman to art.

---

of al g. It is no doubt true that the British Institute aims whole-heartedly to show the work of craftsmen and manufac- illustrate this higher aim and e their work and example—an enough in itself but one difficult , and amid which conflicting rvene to complicate the issue. t speaking here of the pressure cial interests or the detachment t craftsmen, who feel uncertain kind of stimulation for beauty, danger lying in such organisa- omoting the average at the cost , for the average, the good, is so nemy. Moreover, the minds of cautious of us are not able to nce for granted, however well that those who set themselves ique expert committees are the only judges of what is best. Is it, then, so easy to know the best and to recognise it when we see it? It would be a different world were it so. Herein lies the danger of so much of the organisation to promote art, and we confess to a preference for the little leaven. We do not say that these difficulties are altogether ignored by those whose trust in machinery is greater than our own, but it needs great conviction and disinterestedness to secure that the good is not encouraged at the cost of the best, that such movements do not consolidate the average at the cost of the more endowed.

The Permanent Collection. We have already referred in these columns to the permanent collection at the Victoria and Albert Museum, and of the difficulties it represents. On the face of it, it is somewhat absurd to confer the prestige of exhibition in a national museum in such unrepresentative ways. Though the exhibition is not without interest, it would be possible to fill ten times the space with exhibits but little less, and some much more, representative than those already shown. Is the Institute to be regarded as the "unique" adviser on an art the representation of which is so neglected? There are those who doubt whether art can be conjoined to modern industrial methods without great changes. It may be the Institute will help towards these changes. We should like to see it succeed and obtain the support that is necessary to carry on its work. But if it is to do so, it must be accompanied by an outlook holding the balance firmly between commerce and art, recognising that progress does not lie in commerce making use of art so much as in its conversion to the belief of the importance of art to life.

Unfair Restrictions We think Mr. Baillie Scott has done well to call attention to the connection between unemployment and the restrictions imposed by the trade unions. Why should not the unemployed find employment in building houses? we may ask. We all know the answer. It is because the trade unions will not let them. When so many are houseless and workless, how long would it take to train a man in the simple task of laying bricks? Why are we not allowed to do that? Because the trade unions will not allow it. Mr. Baillie Scott rightly says too much skill in building is a curse rather than a blessing. He says, "Is it not possible to remove the baleful and stupid tyranny from the most vital of our industries so that houses may be built for the houseless and work be found for the workless?"

From the Exhibition of the Royal Institute of Oil Painters.

"Over the Bridge." By Mr. Hesketh Hubbard, R.O.I.

GENERAL NEWS

Sheffield Society of Architects.

The Sheffield, Yorkshire and District Society of Architects and Surveyors commenced its programme for the coming session recently, when Mr. H. L. Paterson, the President, delivered his presidential address at Sheffield University.

Royal Academy of Arts.

The Secretary of the Royal Academy states that Professor Laurie's last lecture to the Royal Academy on Wednesday, November 19, at 4 p.m., will be on "Some English Cathedrals and Stone Decay" (instead of "Building Materials," as announced).

A Chair of Building.

During the recent vacation at Cambridge, mention was made of the project to establish a Chair of Building Science and Art at the University. The Institute of Builders is issuing an appeal to its members for £25,000 for this purpose.

Remembrance Day Report.

The Report for Remembrance Day, 1923, has just been issued. Over £259,000 was raised. The Report states that this year it is hoped, irrespective of politics, that all who are interested in the men who saved this country from the horror and degradation of defeat will render practical assistance to the Organising Secretary, Captain W. G. Wilcox, 26, Eccleston-square, London, S.W.1.

Trafalgar-square Subways.

The hoarding recently erected near the Charles I statue in Trafalgar-square indicates a commencement has been made with the improvements to be carried out, which include the construction of new subways for pedestrians. The subways will afford access from the south side of Charing-cross to the Underground station. Trafalgar-square Underground station is also to be entirely reconstructed.

Cast-Iron Houses.

At a recent meeting of the Sheffield County Council it was suggested that the possibilities of other building materials, especially cast-iron, be explored. The use of this would, it was stated, save the country millions of pounds, would set every foundry working, and would find a great deal of employment. It was claimed that houses could be built for £80 less than the Corporation was paying at present.

The Society of Architects.

At a special general meeting of the Society of Architects, held on October 16, Mr. Alfred John Taylor, F.S.Arch., of Bath, was elected President of the Society for the session 1924–1925, commencing on November 1. He succeeds Mr. E. J. Partridge, F.S.Arch., who served the office of President for two consecutive years, during the latter of which he took a leading part in the negotiations which resulted in an agreement for the amalgamation of the Society of Architects with the Royal Institute of British Architects, which it is anticipated will shortly be effected.

Plans must be submitted to the M Agriculture and Water, rue Prole M Belgrade, by December 31, 1924. the competition and plans of the pres may be obtained from the office of the at that address.

Master Painters' Organisation

An international travelling scholarsh value of £50 is to be awarded to appr the course of completing their appre with members of the National Fede Master Painters. Particulars, Mr. W 9, Albert-square, Manchester. For see p. 652.

Harrogate Infirmary Competitio

The design awarded third premium competition was submitted by Messrs. Pite and John S. Hodges as joint a 101 Great Russell-street.

The address of Messrs. Lancheste & Lodge, whose design is placed secon competition, is 19, Bedford Square, W not as given in our last issue.

Christian Science Church, Southp

Designs are invited for a new ch Sunday school at the First Church Scientist, Southport. Premiums of and £30 are offered respectively. The are Messrs. J. E. Sanders & Son, A 219A, Lord-street, Southport, to whom tion should be made, accompanied by a of 10s., returnable only to those wh designs.

Valletta Lay-out Competitio

Designs are invited for the lay-o open spaces and fortifications betwee and Floriana and those encircling Applications for particulars, with a £5, to be made to the Minister of Pub Public Works Office, Valletta, Malta, than December 1. Premiums of £1,00 are offered to the first and second c respectively. An indemnity of £10 awarded to three other designs sho spicuous merit. Sending-in day, Jun Conditions can be seen at this office

Other Competitions.

Other competitions still open u following (the dates given are, first the date, and second the issue of *The* which full particulars were given) Hall (May 1). Manchester Art Galler Aug. 22). Concrete Cottages (Oct. 31

VIEWS CONCERNING BUILDING

(With apologies to the memory of Samuel Butler.)

By JOHN ANGUS.

ere mention that five hundred years rewhonian manner of building houses the same as in our own country. f revolutions had cost the country s in blood and money. During that ouses were built, and a benevolent passed forbidding any increase in e consequence was astonishing, but ful; the shortage of houses increased, one would build. There had been a city of able-bodied, healthy men for urposes, and the leaders began to hemselves in conditions of living, viously, they had taken as a matter

portunity was ripe for doctrinaires their housing schemes maintained at expense. Building tradesmen ob- h wages, and the costs of building uch that people could not afford to without help from the State. The ns began to notice that wages and d according to the number of houses lt. If the scheme were a big one, ld go up; if it were reduced, prices in consequence. It was even hinted uilding trade embraced every oppor- encouraging these State schemes. s were blamed, and newspapers by giving various reasons for the , and warning their readers to watch of people who were taking advantage ation.

be seen that the Erewhonians are by the nose, and are quick to offer on sense at the shrine of logic. As s, they refused to build houses because too costly, so they must be built by There was a great number of un- in the country at the time, and the s, I understand, had predicted that ld be found for them in the building ut with the gradual advance of civili- the meantime, it was found that ons had developed to such an extent umber of men to be allowed to work lding trade was strictly limited, and mit was also fixed.

political party in the country was opportunity of dealing with the roblem, and it was noticed that the building programmes depended upon he deciding factor was sentiment or The Erewhonians were slow to at they were confusing their housing h the problem of how to give houses rkers. When the houses came to be it may be said that the classification kers" was not sufficiently careful, gan to be evident that if everybody ht to a State house no one had an over his neighbour. When the State ened with the responsibility of build- erybody it was realised that the costs much greater than if the individual his own house. It should be stated, s to the Erewhonians, that their had led them to believe that financial houses, paid by the State, were in the gifts.

he evil reached such a pitch that the e, and but for the prescience of a houses would have become as scarce ds. This was the same man, I was was responsible for an Act forbidding n of a statue to any public man or l he or she had been dead at least ed years. He succeeded this time an Act that buildings need not be what had commonly been known as naterials. The effect was instan- An engineer almost at once brought eme for a cheap metal house, and who had already brought cheap r the multitude to a state of per- w turned their attention to the simpler problem of designing a stationary article. At one blow the Erewhonians found that the whole of their labour and material difficulties were automatically settled. Costs of building with the old-fashioned materials and methods came down rapidly to meet the competition, but the development once begun could not be stopped. Traditional methods of building were abandoned, and the industry passed into other hands.

Having settled their housing shortage, the Erewhonians were loth to return to the early forms and methods of building. Amongst many people there was a certain amount of regret that this development should have arisen, but I understood from my informant that the majority considered the whole thing had turned out to be a blessing in disguise. The builders—or rather their tradesmen—had forced the issue, and the Erewhonians had no regrets about knocking on the head an art which had become a trade and then a monopoly. The Erewhonians, five hundred years ago, understood nothing of all this—I doubt whether they even do so now. They wanted to get houses quickly, and cheaply, regardless of the consequences. They came, in a roundabout way, to the conclusion that it was a mistake to build houses to last too long. Housing Acts were amended to keep pace with the great developments in the design and construction of houses, and no Act was allowed to operate for more than five years unless at the end of that time a jury of twenty-four men taken at random from the street pronounced in favour of its being allowed a second five years of life. So cheap were the houses that repairing was discouraged, and the result was, I am told, that the terrible problem of slum clearing was never heard of again.

The mass of the nation are well pleased with existing arrangements, and believe that their treatment of the problem leaves nothing to be desired; but there is an energetic minority, who hold what are considered to be extreme opinions, and who are not at all disposed to rest contented until the early forms of building are revived. I was at some pains to discover the opinions of these men, and their reasons for entertaining them. They admit that most of the old buildings that were abandoned were bad, but some few works were so good that architects of to-day wring their hands over some of the fragments that have been preserved in museums up and down the country. Nevertheless, there were parts of the scheme of which I could not comprehend the fitness, although I fully admit that this inability was probably the result of my having been trained so very differently. I sometimes wondered how it was that the mischief done was not more clearly perceptible. As for the actual houses, I cannot say that I was overmuch impressed with their appearance, although in every other respect they were most satisfactory. They were neat and business-like, but there was too great a uniformity in design to be altogether pleasing to one brought up in an English country-side. The thatched roofs, the mellow tones of the brick, and the stone mullioned windows were always a joy to me, and I cannot believe we should ever want to part with them.

"Haver Werf, Malines." By Mr. Hesketh Hubbard, R.O.I.

CORRESPONDENCE

Peace in the Building Industry.

Sir,—In view of the suggestion that the R.I.B.A. ought to do something and that up to now it has done nothing but wait to be asked, I would like to point out that after the war we took the initiative in forming the Building Industries Consultative Board, and it was much to our regret and that of the representatives of the operatives that the Board ceased to exist owing to the withdrawal of the employers. Again, when the Building Trades Parliament was formed without representatives of the architectural profession, we urged that representation of the R.I.B.A. should be provided for and, as a result of our representation, an amendment was made in the constitution and four representatives of the R.I.B.A. were added to the Building Trades Parliament. The fate of that body is, of course, well known. Within the last few months we have also been endeavouring to get the other parties in the industry to confer with us on the question of building labour and apprenticeship. We have so far failed to get them into a room with us—strikes and other things have intervened. It is all very well to say that the R.I.B.A. must insist on this or that, but if the other parties refuse, what are we to do? It cannot be said that we have not done our best. They are not to be forced.

Arthur Keen,
Hon. Secretary, R.I.B.A.

Sir,—I have read with interest the articles in your two recent issues, and I am generally in accord with the views expressed. I am of opinion that the present condition of the industry needs all the scientific and constructive brains available to restore it to the robust health it used to enjoy. The recent strike appears not to have improved the outlook; on the contrary, matters look to be even worse than before.

Clearly matters cannot remain where they are. There is a general feeling that the high cost of building work is in the main unwarranted. The public mind must be satisfied on this point. While I desire to avoid controversy regarding the handling of the industry, I cannot make myself believe that the best and most lasting results will be obtained, so long as certain sections only of the industry interest themselves directly in its welfare. During the past year I have on several occasions mentioned the matter of the representation of architects on a Joint Board to consider the welfare of the industry, and the suggestion has been warmly received.

It is to architects mainly to whom the public looks to safeguard its interest. Are we to fail them? If so, I venture to think we fail the industry and we fail ourselves.

I am convinced that the time has come when a much wider outlook and a broader handling of matters is essential. I trust the Council of the R.I.B.A. will give this vital question its urgent consideration, with a view to arranging a round-table conference of all parties concerned. If it succeeds it will deserve the gratitude of all concerned. To meet together on such matters is to create a greater understanding and a fuller appreciation of each other's point of view. Only in such an atmosphere, I am convinced, can good and lasting results be obtained.

Herbert A. Welch.

Civic Societies.

Sir,—I am very much interested in your Editorial for October 17, and it occurs to me that you may be interested in the enclosed pamphlet dealing with the old village of Northfield, near Birmingham, published by the Birmingham Civic Society in 1921.* While we have not carried our enquiry in this case so far as is suggested in the letter in the correspondence columns of your same issue, we have been actuated by the point of view which he stresses, and with which we are in entire sympathy.

In the case of Northfield, our effort was stimulated by the danger that this old village might lose much of its charm by the development of improved traffic facilities in the vicinity, and we, therefore, prepared a plan showing how present traffic needs could be accommodated not only without interfering with things as they are, but even providing an opportunity for adding to their attraction.

William Haywood,
Hon. Secretary.
The Birmingham Civic Society.

[*This brochure was reviewed in our columns on Sept. 16, 1921. As our readers know, the work of the Birmingham Civic Society has had good results, and we should like to see similar societies formed in other cities.—Ed.]

A Plea and Plan for an Annual World's Art Exhibition.

Sir,—Though art is universal, it would appear from the catalogues of the three leading art exhibitions in England, America, and France (the Royal Academy, the National Academy of Design, and the Salons) that few artists show their work regularly outside their own country.

This year in London we have had an opportunity of seeing at the British Empire Exhibition an interesting collection of modern British and Colonial art, and quite recently at Burlington House representative exhibitions of Australian and Swedish art have opened our eyes as to what is being done in those countries. The Royal Institute of British Architects have held exhibitions of Swedish, Dutch, and American architectural drawings, photographs and models; some of the provincial art galleries, like Brighton, periodically show modern foreign art. But all these exhibitions bear no relation to one another; they are irregular and ephemeral Some graphic art societies, like the Senefelder Club and The Print Society, regularly send their members' work across the seas, but they would be the last to claim them as national exhibitions, and they do not show foreign work in this country in exchange for the work they send abroad.

Is there no hope ever of seeing regularly in London the work that is being done by the best artists in other countries? I do not think it is possible for any existing society to materialise such a dream because no private society is thoroughly representative of a country—they are limited and handicapped by the very fact that they have members to whom they must give preference, to whom they have obligations. But is it quite impossible to form an international association with no subscribing members? What I feel is wanted is a competent permanent secretary in each country, yet in touch with some central headquarters in each country; a specially selected national committee, not necessarily of artists. In a central gallery in London, New York, or Paris an annual exhibition might be held—one room devoted to each country, as at the Venice International, the exhibits of each country being chosen by its national committee. In a word, is it not possible to have an annual exhibition of the art of all nations?

Just as every nation should be represented, so the exhibition should be shown in every country represented—if not as a whole, at least sections could be exchanged. After it had been shown in a few great cities as a complete exhibition it could be split up and the French section, say, could be shown in New York, and in exchange the American section shown in Paris; and so on—the exhibits thus being shown in many cities during the course of the year. The expenses might possibly be borne by each country concerned.

Now how could such a dream be ised? I would suggest it being start abridged form, say between two c and so developed year by year unti leading countries became participan if a start is to be made, why not America and this country? Extrac little contemporary American art is s here.

We have at this moment on view a ley one of the most representative tions of modern British art that assembled for a long time. Could th sent to America to be shown there u auspices of a specially appointed Committee who, in exchange, cou and send us a representative colle contemporary American art to be sh der the auspices of the Fine Art C of the British Empire Exhibition at (if it is to be opened next year) London gallery or museum such as that is to be opened next month at County Hall at Spring Gardens? our section already brought together; an impartial committee already in ex so now is the time to act. From wha heard from American artists they wo come the opportunity of showing th in London.

Architectural drawings and should, of course, be given as prom place in such an exhibition as pictu the public must be made to realise th tecture is the parent art on which depend.

The advantages to the artists co are, of course, obvious; but I believe scheme properly carried out would ha wider benefits. The exchange of su tesies between nations must surely foster better international feeling. W remember that artists are the une spokesmen of their nation, reflecting t of their age and country. To underst art of a country is a long way towards standing the country and its people.

From a Sketch by Mr. Hedley J. Amy, Probationer, R.I.B.A.

THE ARCHITECT, THE BUILDER, AND THE CLIENT

BY MAJOR HARRY BARNES.

THE Architect, the Builder, and the Client make what in another connection has been called the eternal triangle, and have some of the same disadvantages. The architect between the two may sing with Macheath, "How happy could I be with either were t'other dear charmer away." How happy the life with a host of clients who could be satisfied with designs without demanding execution; what bliss to build without the necessity to consult either the pocket or the taste of a client! Such joys are not for us, ours the more sober and less exhilarating task of satisfying the one and not disappointing too much the other. It is a difficult performance, and that it is so frequently accomplished we may assert is greatly to our credit—if we ourselves have said it. To both clients and builders I tender my profound respects. Without you we should be nothing—embryos *in vacuo*—without either impulse or medium, our castles would be built in the air, and our houses certainly not made with hands.

May I ask you, our clients, to join with us in considering for a little while, usefully I have no doubt, the business in which we become, if only temporarily, partners? This business of building is an ancient and honourable one. I know none which is more, or more likely to endure. I can imagine a society so stable that the lawyer found his occupation gone; so healthy that there was no place for the doctor; so virtuous that no priest should be there, but, while winds blow, rain falls, and sun shines, I cannot imagine the work of building at an end. There is a great canon of evolution that function precedes organism, and it may with equal truth be said that human need, desire and impulse precede the act of building. From this standpoint the client is the individual through which this need, this desire, and this impulse proceed to action. All a little abstract, one may say, but a proper apprehension of it will lead to very concrete results. If an art is to satisfy a need that need must be understood.

Oh, ye clients, if we are to satisfy your wants we must know what they are, and if this is to be so it would seem necessary that you should first know what they are yourselves. Let us get hold of that at the outset. The perfect building is not one which constrains and limits some human activity, but one which covers it as perfectly as the supple skin covers the rippling muscles of the athlete. If we are to design such buildings for you we must know what activities they are going to cover, what sort of human functions, industrial and commercial processes they are intended to house. This you will see is far from an abstraction; it is the intensest realism.

Building begins not with the laying of bricks and mortar, but with the correlation of muscular processes, and the sequence of connected acts. The design of a cowbyre is conditioned by no philosophical theory, but by the sheer naturalism of the physical structure and physiological processes of the animals occupying it, and that same sequential course of raw material and finished products will determine the correct design of the most extensive factory and mill. That being so, you clients must "get over to us," as people in America are supposed to say, your needs. Give us a chance; don't tell us you want a house, or a shop, or any other kind of building and expect us to know just all you mean by that. Building is not a guessing competition, it is worth a little foresight, a little self-analysis, a little analysis of the process in which one is engaged. We architects do become specialists and we can help you to types, but if you want what is individual to yourself or your occupation you must take some trouble to tell us what it is. That will take a little time on your part, and demand a little time on ours. Be patient, we really are remarkably quick in picking up what is meant, but it can't be done absolutely instanter. We shall try to convey to you what we understand you to want. On your part spend a little time to make sure we have really got hold of it. It will pay us both. Don't credit us with a superhuman faculty of intuition, we really haven't got it; most of us have nothing but a capacity, infinite or not I will not say, of more or less laboriously acquainting ourselves with our clients' needs. Some day, perhaps, you will be willing to make it possible for us to furnish you at the outset with the services of a new member of our staff who, for want of a better word I will call an "apprehender" or "comprehender," who will be at your pleasure for a sufficient period of time in your home, or your place of business, or your club, or wherever it is you want our services, to observe and note those special requirements of yours which we must meet if the building we are to supply you with is to fit you like your glove. Meantime give us what chances you can to become as intimate as may be with your desires, so we may escape at the end the complaint that this has been overlooked and that has not been foreseen.

There are other matters on which I may perhaps take advantage of this opportunity to bring before our clients in this impersonal way. Building, after all, is something which does concern in some of its aspects others than the three who are the subject of my pen; it is not entirely our own affair. The part of the building which presents itself to the public gaze may either add to or detract from the amenities of the area in which it is placed. We architects are sometimes charged with being more particular about the external appearance of our buildings than about their internal disposition. This charge I need hardly say is neither true nor merited, but it is one of the great parts of our task to endeavour to present the embodiment of the private necessities of our clients to the world in such a guise as not to be offensive, and in this part of our task I crave the co-operation of our clients.

I have no space in which to enter on a disposition upon æsthetics, or to attempt to solve the baffling mystery of proportion, line, texture and colour which in harmony make an object agreeable, and in discord make it objectionable. We must get rid of the feeling from which comes the expression, "it doesn't matter how it looks as long as it serves its purpose." There is no necessary divorce between beauty and usefulness. On the contrary, whether it can be exactly proved or not, there is little doubt that the more perfectly adapted an instrument is to its purpose the more beautiful it is likely to be. You must come to us then, not only with a sense of your requirements and your capacity to pay for them, but also with the conviction that in erecting a building you are permanently imposing upon public notice a spectacle which may be edifying and gratifying, or the reverse. To behave decently in public is not something which is to be confined to our speech or gestures, it needs to be extended to the clothes that cover us and the houses that shelter us.

In the eighteenth century, if not at other times, it was regarded as part of a polite education to have an appreciation of the fine arts. We shall certainly never achieve the building distinction we seek until you, our clients, be you private or public, approach us with an interest not only in the utilitarian objects which the buildings you contemplate are intended to serve, but also in the æsthetic value they may possess for the general culture of the times.

A note or two on building costs. The ideal expenditure of money is that which produces the largest result in quantity and the best result in quality, and at such results it is proper to aim. If I might offer one piece of advice to our clients on this matter it is that if to obtain the two is impossible, if sacrifice must be made, then let quantity be sacrificed to quality, and reverse nothing be done.

The hardest part of the architect's is the effort to fit the quart of accom into the pint pot of financial resource give the client all he would like to g money. Of that, may I say to ou don't press us to the makeshift and t tute. Be content as far as may be to requirements wait upon your resources, the limitations that the use of so struction and good material may imp you rather than fly to the expansio by flimsy and inferior alternatives. T be counsels of perfection it may be, aim at achievement of which both of be proud. You place in us much co you give us much power, you entrust position of much of your resources to relationship between us is peculiar and i we appreciate it all and would have it off by a completeness of understand sympathy, of which the building work w take together shall be the joint produ

Complete, however, as the understand be between architect and client, the re of their common interests rests large their common friend, the builder. I term "friend" advisedly, for buildin mere transfer of commodities which effected without any human nexus; i inter-weaving of services that can only their most and best if given in an atmos goodwill.

I can imagine some of the things member of the Institute of Builders mig and very usefully say, to the architectur fession, and with that in my mind, will from entering on any observations that offer the least excuse for recrimination are neither of us infallible or omniscien being human, do err. You builders co our offices and see our drawings, and the politeness which is native to you, kee opinion of them to yourselves. Well you however, and well we know it, that, if t to pass from paper to solid tangible it will only be by the application of yo perience, ability, and resource. Throug we get access to the craftmanship and ma that are to be embodied in our work design, but you execute, and on that exe how much depends. You have to bring your treasures things new and old if ou is to become what we want it to be.

I am not going to write anything abou tracts or specifications and quantiti certificates and penalty clauses. I would remind the builder that he is the keeper door through which both craftsmanshi material reach the work. If these are maintained at the highest standard, cannot be without your support. It i we should get behind the financial relati formed under a building contract and trate rather on the work that has to formed. We know very well of the diff you have to encounter in carrying o industry—the limited supply of labo materials, and the unprecedented dema both. To overcome these difficulties, d from the builder of to-day qualities an cities far beyond what was necessary predecessors. Labour disputes and a manipulation of the main building ma so as to produce price inflations, all m contractor's task an increasingly onero Of these I would say no more than to w a happy issue out of all your troubles.

What I would bespeak is a continu developing interest in the fostering o elements of our joint undertaking, the of the skilled craftsman, and the produ sound and artistic materials. It is not to comment on their absence, it req ensure their presence. If it be that system of apprenticeship is no longer priate to the working conditions of the i it is for the builder, perhaps more than a section of it, to be devising a new me producing the skilled workman. Don't difficult financial aspects of your crowd out these considerations. We m

workmen if we are to have good building, ood workmen are made, not born. It is for o take the principal hand in their making, ne only hand—in these days that is im-ble; there must be secured the co-operation e workman, and I am one of those who e that a common interest in the craft do much to ease the situation when the lt questions of wages and hours reach their ing crises.

regards materials there is also ground for eration. It is to all our interests—clients, actors, architects and operatives—to have undant and cheap supply of the best ials. Can we not unite to explore the ilities of securing this? We have a Board ilding Research, we have a Science Com-e at the Royal Institute; why cannot the parties in the art of building unite in a serious effort to discover new, or expand urces of supply? We architects can control roportions, the mass, the outline of our ngs, but for their texture and their colour pend and must depend on the quality of aterials that are available.

vice-chairman of the Committee recently by the Government to inquire into new ds of construction and new materials in or building, I have an open mind for all sals and am willing to take any new depar-that can be justified, but I cannot help ng that we have not yet exhausted or approached the exhaustion of the supplies se well-tested and time-approved materials fore classed as building materials. The e and colour of them at their best are as things of beauty and a joy for ever as any ever spun. Whoever has had the good e to see old brickwork and stonework that ot been exposed to a smoke and sulphur-atmosphere will endorse what I have said, as to wood, how it mellows with age and, cared for, takes on a bloom which might a nut-brown maid.

't let us divide the terms of art, and do uilders not let the architect reserve to f such terms as colour and texture, while you are content with cubic feet and square yards. Let us agree that building is not to be measured geometrically alone, but by those finer scales that will take into account not only the size, weight, and breaking stress of the materials employed, but also their surface values as they appear to the trained and cultured eye. Let us join to deliver the goods to our joint employer, the building owner.

But I hear a murmuring: "What of yourselves; are there no admonitions for architects?" Alas! for me, if anything I have written has sounded like admonition it arose from admiration out of experience; but I agree I should not round off my topic had I no word for our own ears. We architects are not unconscious of our own imperfections; are we not reminded of them in every building we pass?

I can well imagine that if our clients and our builders forgathered and discussed us our ears might burn a little. Still, we do well to remind ourselves occasionally what may properly be expected of us as we take our place in this trinity of building agents.

First, I think it is that every work entrusted to us deserves equal consideration, not in extent but in kind. There are no degrees in perfection and it is at perfection we must aim. After all, the number of small jobs must always far exceed the number of large ones, and if we are to get that elusive quality of charm into our villages, towns and cities, it will be on account of the work of those of us who live on the small commissions much more than of those to whom are entrusted the larger ones. It is not by size, not by cost, but by the love and care of the designer and craftsman that beauty is revealed. Let us put our best at the whole-hearted service of our client, whatever the depth of his pocket.

Then let us, too, not be found wanting in the civic spirit; there is a kind of team play wanted in architecture as well as in football. We must resist the people who want to control the artist in his work, but it is perhaps not too much to ask of the artist that he should control himself, if but a little. Don't let us disregard too much what stands beside our work; let us take a lesson from the designers of Bush House, which, rising like a cliff from the Strand, pays on its face the most delicate of tributes to St. Mary-le-Strand. Architecture is an engrossing pursuit, and leaves its devotees but little time from their devotions, but I cannot help hoping that a growing number of its practitioners may find some time to give to public duties, realising that the great art is to be served at the council table as at the drawing board, or on the work.

When we are seized of our client's needs and in the spirit I have indicated are engaged in their satisfaction, we might perhaps take our courage in our hands and tell him what he can have for his money and what he can't. It is perhaps not easy to be the chilling wind to his expectations and to nip them in the bud, but much of the dissatisfaction that does arise is due to the failure to face the facts and to convince our clients at the outset of what is a reasonable expectation to form of the provision their resources will afford. Perhaps we might even sometimes go beyond that and not only tell him the cost of providing for his wants, but also indicate to him which of those wants are real wants, and which are artificial or unsocial.

Such speech cannot be mere bluntness; it must be tempered by tact and guided by discretion, and based on the belief that only time is required to bring our client to the same conviction as ourselves.

Perhaps most of all we should be continually reminding ourselves of the great and exceptional confidence that is placed in us as a profession both by the client and the builder. In no walk of life is more implicit confidence placed in the probity of the human conduct of affairs. Great problems are entrusted us to solve, great resources to expend, and great discretion to exercise. Our opinion on many things is taken as final and our good faith accepted without question. These are matters that should make for humility, coupled with a determination to be worthy of our high calling and so to act that from client and contractor alike we may retain a confidence unimpaired.

Competition for a Memorial at Ottawa, Canada, to the Late Sir Wilfrid Laurier.

The New Zealand Memorial at Gallipoli.

The British Memorial at Cape Helles (previously illustrated in *The Builder*), designed by Sir John Burnet, A.R.A., R.S.A., marks the landing of the British Forces on April 25, 1915; the impressive New Zealand Memorial at Chunuk Bair marks the climax of the campaign.

The New Zealand monuments on other battlefields have been erected so that effect is gained at close quarters. At Gallipoli the work has been done with a view to obtaining the greatest effect at a long distance, and in designing the Chunuk Bair Memorial the architect, Mr. S. Hurst Seager, F.R.I.B.A., has kept in mind those who pass in and out of the Dardanelles, the great maritime gateway of Asia.

The monument is 45 ft. in height, 20 ft. in width at the base, diminishing to 13 ft. at the top. Its plan is in the form of a Greek cross; the buttress-like projections forming the arms of the cross face nearly to the cardinal points, so that in sunshine the southern buttress is illuminated throughout the day and throws its shadow within the bright outline of the monument, thus enabling it to be seen from a much longer distance than would otherwise be the case. The whole of the structure is of reinforced concrete faced with stone—a white, compact limestone from the Unger Dere quarry on the Peninsula. The surfaces of the stones are worked to a rock face. A magnificent view of the monument is obtained from the Ægean Sea, but there is very little traffic down this west coast of the Peninsula. Though the distance of the memorial from the eastern coast is greater, it can be easily seen from the decks of the many vessels which pass up and down the Narrows. It is also visible from Chanak, eight and a half miles distant.

Just below the monument is the Chunuk Bair Cemetery, where eight known and 856 unknown New Zealanders lie buried. The beautiful work in this cemetery—simple and dignified—has been designed by Sir John Burnet. Its ordered rows of headstones, the memorial cross set in the centre of the stone balustrade, the background of dark green trees and shrubs, all lead up harmoniously to the massive towerlike monument beyond—perfectly attuned to its setting and conveying its message to all those who pass to and fro on the highways of the sea.

The contractors were Sir Payne Galway & Co., who have carried out their work under the superintendence of the staff of the Imperial War Graves Commission.

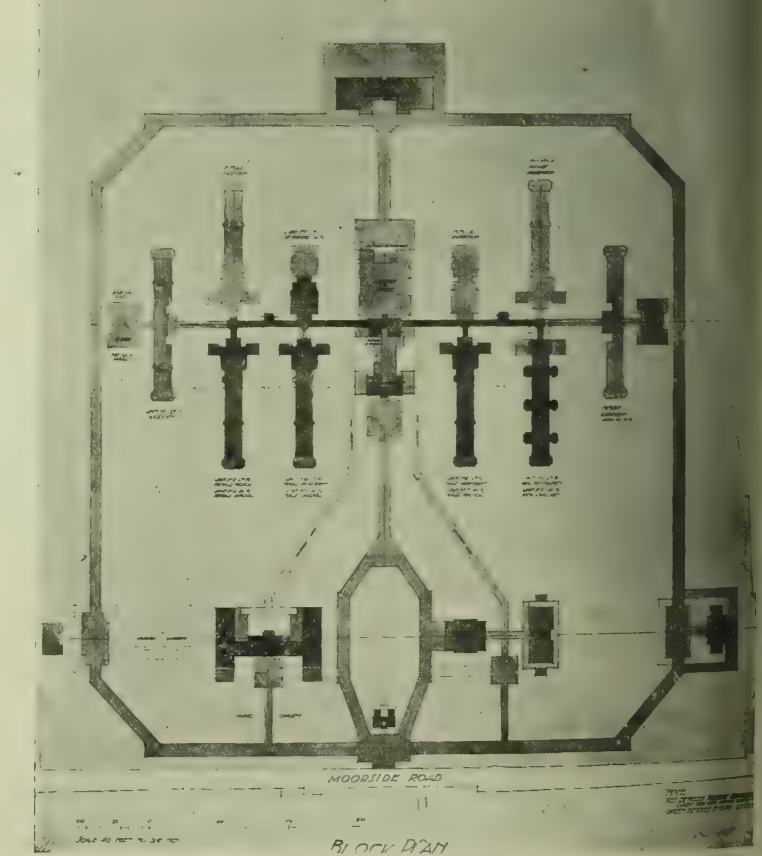
Leicester Fire Station Competition.

We give this week the accepted design in the Leicester Fire Station Competition, by Messrs. A. E. & T. Sawday, F. & A.R.I.B.A. Mr. Stockdale Harrison was the assessor. The full result of the competition was given in our issue for February 29.

The site of the new fire station is on Lancaster-road. The station and the houses for the brigade will utilise all the front land from the railway to the bowling green at the corner of Victoria-road. Lancaster-road, now 40 ft. wide, is to have 20 ft. added to its width on each side, and the fire-engine house will be set back 40 ft. from the road, so that from the building line of the station itself to the other side of the road there will be a space of 120 ft.

The estimate for the scheme is £36,284. Plans were required for a fire station, houses for the chief and the first and second officers, and 37 cottages for the firemen. Provision is made for a square block of buildings of two stories, embracing the engine-house and administrative department and offices, on the front. The workshops and stores will occupy the ground floor in the rear. A large yard will divide the front from the back, enabling the engines, upon returning from a fire, to be driven along a carriageway south of the engine-house to the rear of the latter. The story above the workshops and stores will serve for a recreation-room and other offices.

Davyhulme Hospital Competition.



We give this week the designs placed second and third in the Davyhulme Hospital Competition, by Messrs. H. V. Ashley & Winton Newman, FF.R.I.B.A., and Messrs. Adams & Holden, FF.R.I.B.A., respectively. The design placed first, by Messrs. Elcock & Sutcliffe, F. and A.R.I.B.A., together with a review of the designs submitted, were given in our last issue.

"Greenbank," Chester.

"Greenbank," Eaton-road, Chester, w in 1820, in the prevailing neo-Grec style, typical painted stucco house of that peri interior decorations were strongly influe Soane, and the architect may have bee Harrison, who designed the County B and the Dee Bridge at Chester. Oppo was taken during some recent interior struction to remove the old painted stu to recoat with "Atlas White" cement, a gatehouse which provides accommoda two of the servants, and to erect new e gates and frontage walls. The gateho been built to the design of Professor R Liverpool University, and the entranc were designed and supplied by The Birm Guild, Ltd. The low pitch of the ga roof precluded the use of tiles or slates, roof is covered with sheets made of steel with bitumen and asbestos, manufactu Ellesmere Port, Cheshire, by the Wolverh Corrugated Iron Co., Ltd. The carrying the work and much of the planning h superintended by the owner, Mr. E. Peter and the interior decorations have been out by Messrs. Ashby Tabb, Ltd., Liver

Chiswick Baths and Washhouses.

In our description of this building in o issue we inadvertently omitted to sta the general contractors for the work we well-known firm of Messrs. A. Roberts Ltd., 74, Earl's Court-road, Kensington.

NCO-BRITISH UNION OF ARCHITECTS

urth annual meeting of the Franco-Union of Architects was held in the the Société des Architects Diplômés, the 10th inst.

al, official business was limited to a , and the chief part of the meeting of a visit to the Opera and to recent in Paris, etc.

egard to the meeting itself, the only f particular interest were the election resident and Bureau for the session and the unanimous agreement arrived oint a special sub-committee of the inquire into the working of the exist-ations for international architectural ons and the desirability of amending ying the same from the standpoint chitectural societies of Great Britain ice.

ommittee, consisting of the following : Messrs. Defrasse (vice-president, ., and architect to the Bank of etc.); S. D. Adshead, F.R.I.B.A.; J. Davis, F.R.I.B.A. (hon. sec., Committee, U.F.B.A.); Légros (pre-S.A.D.G.); Louvet (past president, .); H. V. Lanchester, F.R.I.B.A.; Simpson (past president, R.I.B.A., president, U.F.B.A.); and Tournaire, de la Fédération Française des es, will conduct a preliminary exami-the whole question and report on r to the next general meeting, which place in London about July 15, 1925. from this it may be of interest to the Bureau of the Union for the session 1924-25 is constituted as

nt, Paul Waterhouse, M.A., F.S.A., .A.; *Vice-President*, A. Defrasse, e en chef des Bâtiments Civils et Palais s, Architecte de Banque de France, esident S.A.D.G.; *Secretary-General*, Fart de Lafontaine, T.D., O.B.E.; , J. M. Poupinel; *Hon. Sec. British* e, A. J. Davis, F.R.I.B.A.; *Hon. Sec. Committee*, A. Schneider, S.A.D.G.

s: British Committee—S. D. Ads-.I.B.A.; Sir John J. Burnet, A.R.A., LL.D., &c.; E. G. Dawber, V.P. H. M. Fletcher, F.R.I.B.A.; H. C. , F.R.I.B.A.; Arthur J. Davis, . (*Hon. Sec.*). French Committee— ident of the Société des Architectes ; Charles Girault (Royal Gold Medal-Bérard, S.A.D.G.; J. Hébrard, de Saint Maurice, S.A.D.G.; A. S.A.D.G. (*Hon. Sec.*).

llowing gentlemen were elected as of the Union:—H. W. Ansell, M.C., .; E. M. Collins, F.R.I.B.A.; Sir Lorimer, A.R.S.A., A.R.H., .; A. C. Dickie, F.R.I.B.A.; Holt, A.R.I.B.A.; P. D. Hepworth, .; Gilbert H. Jenkins, F.R.I.B.A.; Jones, F.R.I.B.A.; S. Rowland .R.I.B.A.; L. Sylvester Sullivan, .; Henry Tanner, F.R.I.B.A.

day two visits took place: in the he new branch office of the Bank of the Place Malesherbes was in-der the guidance of Monsieur A. architect to the Bank, and in the a visit was paid to the Opera, nsieur Patouillard-Devienne, the rchitect, kindly conducted the party portions of the building not usually to the public. Both visits were of le interest: in the first case, the unique because the many interest-of art which existed when the as acquired have been carefully pre-incorporated in the alterations, and se the very extensive strong rooms are surrounded by a moat and a movable drawbridge which, when withdrawn by electric power, not only removes access to the strong room but also closes the steel gates, etc.

In the visit to the Opera, the Conservatoire and administrative departments were inspected.

On Saturday a visit was arranged to the important public baths at Les Tourelles, Porte des Lilas. This is an interesting reinforced concrete structure with a great open-air bath some 150 ft. long by 60 ft. wide. It was constructed in eight months at a cost of approximately 8 million francs for the recent Olympic Games.

After this visit a certain number of delegates went on to see the new church of St. Louis de Vincennes, also in reinforced concrete, which was explained by Monsieur Marrast, the architect.

In the evening the official banquet given in honour of the British section by the S.A.D.G., took place at the Salle de l'Hotel Lutetia. There was a large attendance, and among the guests were Mr. Yeames (representing H.E. the British Ambassador), and Monsieur Roussel le Roy (representing the Prime Minister of France). In accordance with the unwritten law of the Union, speeches were limited to a minimum.

Monsieur Godefroy, President, proposed the health of His Majesty the King, the Queen, and the other members of the Royal family, and subsequently delivered an address of welcome to the British delegates, concluding with the toast of the R.I.B.A. and the Franco-British Union.

Sir John Simpson proposed the toast of the President of the French Republic, and referred to the achievements of French architects, and the great heritage of their glorious tradition.

Monsieur Paul Léon welcomed the British members on behalf of the French Government, and said that he need not remind those present that England was an island or that it possessed a long and glorious history. In times past the seas may have presented a barrier, but this was no longer the case. The exchange of ideas for which the Union was formed united the " intellectuels " of the two countries. In France the influence of English architects was marked in the home, and in both their countries architects had an important place in the history of civilisation. He would like to take this opportunity of referring to the important exhibition of the Decorative Arts which was now being organised by the French Government, and which was to take place in Paris next year. Its scope was no doubt not so vast as the exhibition at Wembley, which he had recently visited, but he thought they would find much that would interest them in the Exposition des Arts Decoratifs. Monsieur Léon concluded his remarks by saying that he thought his audience would agree that the greatest misfortune that could befall mankind would be the extinction of the architects.

On Sunday the proceedings terminated with a visit to the " Maison des Artistes " in the fine house of the late Monsieur Rothschild, left to the State for this purpose under the terms of his will. Here Monsieur Paul Léon received delegates on behalf of the French Government, and a visit was made to the fine library which contains many unique artistic treasures.

Durham Architectural Society.

Members of the Durham and Northumberland Archæological and Architectural Society held their fourth outing of the year recently, when they visited Cleveland. They commenced from Stockton, and were conducted by the President, Mr. A. Hamilton Thompson, F.S.A., round Kirklevington Church, Crathorne Church, and Hutton Rudby.

SOCIETY OF ARCHITECTS

The jury appointed by the council of the Society of Architects to adjudicate upon the drawings submitted in the Victory Scholarship this year have awarded the Gold Medal and the prize of one hundred pounds for the design sent in by Mr. C. H. Short (*see p.* 635-6), of the University of London School of Architecture. In addition to this prize each competitor who completed his designs in the final round was awarded the completion prize of five pounds. The whole of the designs in the final Competition are on view at 28, Bedford-square. A full criticism of them will be given by Mr. H. V. Lanchester, F.R.I.B.A., on November 13, at 8 p.m. The programme for the final round this year required a design for the main group of buildings for a public school. The Society was represented on the jury by Messrs. L. Sylvester Sullivan and H. M. Robertson, the University College by Professor Richardson, the competing schools by Messrs. L. H. Bucknell, G. Hake and L. Budden. The external members were Messrs. A. J. Davis and H. V. Lanchester.

The competition has produced some good work although the response is perhaps hardly so good as one would hope for, but the award is not one which is likely to be questioned.

The winning design shows skill in the plan and some originality in the exterior treatment. Neither the hall nor the cloister are very happy in proportion or detail, but the design as a whole appears to deserve the award.

No. 177 deserves special mention for its elevational treatment, and 172 for its combined quality of plan and elevation shown in a very well executed set of drawings.

Though there are points of quality in some of the other designs, they can hardly be said to have been in the running.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

We have received the Syllabus of the Royal Institute of British Architects for the session 1924–25. The principal meetings are as follows:—November 3—Inaugural meeting: President's address. Nov. 17—General meeting: " Planning for Good Acoustics," Mr. Hope Bagenal. December 15—General meeting: " Shop Fronts and Their Treatment," Mr. Arthur J. Davis. January 19—General meeting: " Applications in Building and Foundations of Modern Engineering Construction," Dr. Oscar Faber. February 2—General meeting: President's Address to Students at 8.30. Presentation of prizes. Feb. 16—General meeting: " Sculpture in Relation to Architecture," Mr. D. S. McColl. March 16—General meeting: " The Corporate Spirit in Architecture," Mr. F. R. Hiorns. 30—General meeting: " The Architectural Treatment of Ferro-Concrete," Mr. A. Beresford Pite. April 20—General meeting: " Natural and Artificial Lighting," Mr. Percy J. Waldram. May 18—General meeting: " The Influence of the Popes on Renaissance Architecture," Mrs. Arthur Strong. June 22—Presentation of the Royal Gold Medal.

After the inaugural address by Mr. J. Alfred Gotch on November 3, the R.I.B.A. medal and diploma for the best London street frontage, 1923, will be presented to Mr. Francis T. Verity, F.R.I.B.A.

Town-planning Lectures.

A course of seven lectures on Town-planning and Town Improvement has been arranged, under the auspices of Armstrong College, Newcastle. The first lecture was delivered on October 21 by Mr. Raymond Unwin, who dealt with " How Town-planning May Improve City Life." At the conclusion of the course a public exhibition will be held with the co-operation of the M.H. and the Newcastle civic authorities in the King Edward VII. School of Art.

TOWN-PLANNING INSTITUTE

LEEDS AND BRADFORD REGIONAL COMMITTEE

We give below an extract of a paper read by Mr. R. H. Mattocks, Chief Surveyor to the Leeds and Bradford Regional Joint Town-planning Committee, at the annual country meeting of the Town-planning Institute at Leeds recently. A paper read at the meeting by Mr. W. T. Lancashire (President) on "Town-planning Schemes of the Leeds Corporation" was given in our last issue.

The work of the Committee, he said, was the necessary complement to proposals of the Leeds Corporation. Each authority in making its scheme naturally tried to obtain the maximum improvement in its own area, and usually in the areas immediately adjoining. When acting alone on a scheme which reached to its boundary, an authority could only secure adequate protection for its zoned areas by going beyond that boundary. Yet many authorities shrank from the trouble and antagonism which might arise—and the extra cost involved—when a portion of the area of another authority was included. The result was that they either did not go forward with their schemes or else knowingly left them incomplete by stopping at their own borders.

Regional planning, substituting as it did co-operation between neighbours for the compulsion of one by the other, provided a via media for these authorities, and an encouragement to go forward with the preparation of their town-planning schemes. In addition it could make possible the provision of many improvements which could only be secured by co-operation, *e.g.*, the widening of a main road from end to end. Also without proper co-operation it was useless to attempt the development of new cross-country routes; the short section within the area of one authority might have no connection to any other main road under that authority, but, linked up through the region and joined on to the section in the next region, its effect on development in that area might be incalculable.

The functions of the Committee, as given in the constitution, were under four heads:

(1) To advise in the promotion, co-ordination, and linking up of town-planning schemes within the area. Like other regions they had authorities at all stages of town-planning development. The majority had not passed the first resolution, whilst others had their schemes finally approved. The former were just beginning to realise how unprepared they were to criticise the schemes of their neighbours, and how the lack of organised ideas as to the future development of their areas made it possible for those schemes, whilst apparently doing no damage, to be really blocking some desirable line of development. Some eleven or twelve authorities had already passed the resolution, others were preparing Map No. 1, whilst others seemed to be waiting until the regional map began to take shape. It would be a great pity if many were to stay in this last class, as intensive study of local problems was bound to be helpful to the authority and also to the proper understanding of the suggestions for the regional map. He always endeavoured, when meeting the members and officials of the various authorities, to get at the purely local view of the desirable development, as each view gained was another sidelight on the problems in that area.

(2) To proceed at once with the preparation of a regional plan for the area, indicating by way of recommendations, together with any other particulars which the Committee might consider necessary, the following:—

(*a*) Chief lines of communication by road, rail, and water, including suggested widenings and improvements of existing roads, and the lines of suggested new roads. These were being examined and considered historically, commercially, and from the topographical point of view.

(*b*) The zoning would be a most important consideration, and a very careful study of existing conditions and proposals would be necessary before suggestions were made.

(*c*) In studying the problem of open spaces a number of factors would have to be considered. For instance, there was the question of water catchment areas, and their possible extension in the future. Then there was the land liable to flood; what effect would the extension of the catchment areas and dams and the consequent reduction in the amount of water escaping into the rivers have on it? Could this good effect be helped by a judicious afforestation of some of the high land? That was worth inquiring into, as it was well known that the water from heavy rains, checked in its descent by meeting first with the foliage of the trees, was better retained in forest soil than on bare land. Under a close cover of trees there collected a spongy humus soil formed from the decay of fallen leaves. Through that the rain water slowly filtered, and its passage was further retarded by the stems and roots of the trees. Such conditions were particularly effective in reducing the liability to sudden floods after heavy thunderstorms. The reservation of open space for the preservation of pieces of beautiful country and other aspects of the open space question would be inquired into, particularly those which affected those built-up areas now tending to grow together.

(*d*) The geological, geographical and topographical conditions pertaining in the area. Geographically the area was centrally placed, being so situated that goods could be shipped with equal facility from either east or west coast ports. The region was also near the large home market formed by the busy Lancashire factory area. For power they had the great coalfields which underlay most of the region. For health and pleasure they had Ilkley within their border and two spas, Harrogate and Boston Spa, just outside, whilst within a radius of seventy miles struck from midway between Leeds and Bradford lay many of the east and west coast holiday resorts, including Whitby, Scarborough, Bridlington, Morecambe, Blackpool, and Southport. In or near the area were many places of archæological or scenic interest.

(3) To consider and make suggestions or recommendations on any matter relating to the effective town or regional planning or development of the area, or upon any other co-essential matter. Perhaps the most important part of the work under this head was the collecting, by means of personal interviews with the surveyors and other interested people connected with each authority, of the local viewpoints on all matters relating to the development of each unit of the region. It was only by the collection of this local knowledge that the proper steps could be taken to reconcile differences between adjoining authorities. Such knowledge was also necessary when examining a town-planning scheme for one district adjoining another which had not yet commenced to prepare a scheme.

There was the most important point of co-operation between regional committees. This was quite as important as co-operation between the various units of the region, and they were hoping that the adjoining committees would soon begin to function properly and allow of the appointment of the liaison committee proposed by the Manchester and District Regional Committee.

Penrhos College Hall.

A new assembly hall is in course of erection at Penrhos College, Colwyn Bay. It is estimated the building will cost £150,000; the architects are Messrs. J. M. Porter & Co., Colwyn Bay.

MEDIÆVAL TOWN PLANNING.

Mr. William Haywood, F.R.I.B.A., second lecture on town planning at Birm University, said the period of conques A.D. 1000, in Europe, led to the b of many towns of an almost exclusively r character. The first Norman towns of En the Bastille towns built in Proven Louis IX, to wear down the resistance Albigensians; and the English towns of and North Wales built by Edward I, a trated the predominant character of th

It was only here and there that they the building of cities undertaken sole residential and commercial purposes, such towns Salisbury, Hull, and Win in England and Carcassonne in Provenc examples.

The new Salisbury was built becau inconvenience of the old hill city was too a handicap for its inhabitants in time of In A.D. 1220 Bishop Richard le Poer l new city in the rich meadow lands so Old Sarum for the greater convenience flock, and with the uncharitable obj diverting trade from the flourishing b of Wilton, three miles to the west. The was of the chequer-board type; there w defensive walls; the waters of the encircled and protected the town; an spacious streets—each with a central st of running water—were unusually attra Hull was built by Edward I as a port t City of York, and to replace Ravenser w by the erosion of the east coast, was threat with destruction.

The New Winchelsea (originally Iham built by Edward I in 1281, to replace Winchelsea. The King assessed the new very heavily, and it was not until the threatened the old town with complete truction that its people yielded to this pulsion, and an abatement was made o original terms. A few of the original 3 sulæ still remained.

The lower town of Carcassonne was bui Louis IX in 1247 without walls, because King wished to house an industrious and u people, while depriving them of the mean resist his authority. The town still ret the chequer board pattern of its original pla

This consideration of ancient towns had been planned outright would be incom without reference to the inconvenience monotony of the square mesh arrangeme streets which was almost universal down t sixteenth century, and which had persist many places—notably in America—until to The chief inconvenience of this arrang arose from a lack of roads in a diagonal dire the need for which was apparent from the and costly schemes of alteration imposed modern American towns in order to make this deficiency.

Ancient towns were usually so small in and the traffic needs were of such a kind the need for diagonal routes was probabl felt, but whether the town be large or the gridiron type of design was inconv and costly on hilly sites. Its characte monotonous, and it was directly oppos an adequate architectural treatment of forms. Many mediæval towns with appa no regularity of plan, and even an appe of confusion, would be found well adap the local topography and far more conv and pleasant to live in than towns whic a greater appearance of utility because plan was highly artificial.

New Wolverhampton Factory.

Messrs. Melville Dundas & Whits Glasgow, have obtained the contract for new factory at Bushbury, Wolverha Messrs. Courtaulds, Coventry, for whom th is being undertaken, are reported to be sp £1,500,000 on the building. Work is started immediately.

UIPMENT OF A LARGE COUNTRY HOUSE

. H. Barker, B.Sc., Lecturer in Heat- Ventilating Engineering, University recently gave an address at the on this subject. In the course remarks he said he gave a lecture equipment of a small house last year, would be interesting, as a contrast, to the equipment of a large house, where blishment was more or less dependent own resources, and where the equip- as not curtailed for lack of means, as ly was in a small house. The out- requirement of an establishment of racter which might be supposed to be by a country gentleman of some who was in the habit of entertaining iderable number of visitors, was y. This feature was one of the most nt to the success of a plant of this r. A country house, especially if far from railway station, town or village not infrequently the case), was very dependent on its own resources for the comforts and amenities of life. far beyond the reach of a gas main, wer or electric-power station; there r might not be a water main; and, r. all supplies of every kind from coal had to be conveyed a long distance op or railway. Owners of such would not be content to occupy nless they were able to have d of the ordinary facilities and com- which they were accustomed in their uses. Indeed, unless it were possible the same sort of life in the country, ds comfort, as was possible in town, ht suppose that houses of this nature e largely de-populated. Hence, if f this grade were to live a country ll, it followed that the supply of the must be provided by special small

Supply.—Chief among these require- ust be a good supply of water, without fe in a house of this character would pportable—indeed, impossible. For pose recourse was frequently had to There were many places far out in try where a main water supply was ; it was, nevertheless, usually neces- ink a well and to provide the necessary equipment and reservoir, and if r. storage tanks in the house itself. oper equipment was possible the vil- p was the only resource. Sometimes, e, water could be obtained from a the vicinity, and if such be situated ground, it might be that a perfect pply could be obtained at very little high degree of purity. Failing this, ften several hundred feet deep might be sunk, from which the water was ther by a windmill specially provided urpose, or by the usual means. In y cases it was necessary to rely on mping from a shallow well, up to f the house, and this often was done ardener or odd man employed about ses. It was always found a nuisance. cases it was possible by ingenious o do the pumping satisfactorily by f a simple hot-air engine or small paraffin engine. In one case known ecturer the family motor cycle was ts spare time for pumping the water e top of the building. Whatever as adopted, a good cold-water supply very foundation of success of the ng equipment, and whatever the size. re far removed from the ordinary of modern life, the proper provision ntailed an amount of organisation s often difficult to maintain.

Requirement.—The next general re- t was that of mechanical power. factory modern life a supply of power st a necessity though, perhaps, not any rate for the type of house they were chiefly considering it might be said to be necessary. If outside power was required, it was necessary to introduce either locally fixed engines driven by paraffin or petrol for individual purposes or, far preferably, supply a central power plant with battery of cells for the production of electric current. For a relatively small electric plant of this character, it was not advisable on many grounds to exceed a voltage of 110 to 120, otherwise the battery became alarmingly expensive. There were other reasons why a higher voltage than this was undesirable. If such an equipment was provided, the tendency was to rely on it absolutely for a great many services, and a breakdown of the electrical—especially the generating—equipment would paralyse the activities of the whole house. It was therefore necessary, if an electrical outfit was provided, that it should be in duplicate, so that one engine was at all times at rest, and both could be kept in perfect order without stopping the supply. The type of engine most desirable for this service depended to some extent on the amount of power called for.

If it were a small place, very useful combinations were on the market of petrol-driven engines combined with somewhat low voltage dynamos and batteries. Twenty-five volts was common, 50 was less frequently used, but the most desirable for a place of moderately large size was 100 volts. The amount of power required varied greatly according to the habits of the establishment. A very wealthy establishment used proportionately an enormously greater amount of power than an economically administered one. It was difficult to lay down any definite rule.

Petrol-Gas.—Another service of great value to a country house of this character was an installation of petrol-gas. There were several excellent appliances on the market for satisfying this most useful requirement. These were quite automatic in action, and would give a supply quite as good as town gas for an outlay which (dependent, of course, on the price of petrol) was in any case very little more and usually considerably less in the depths of the country than the cost of a town supply. The purposes for which it could be used were such as might in other circumstances be served by power electricity, such, for instance, as cooking, heating by gas fires, and perhaps the boiling of water and the heating of laundry irons, and possibly a certain amount of lighting in places where for some reason it was inconvenient to supply electrical power—certain stand-by gas lighting might be very useful on some occasions. The ramifications of gas pipes could extend all over the outbuildings, and there were many cases where gas was of very great utility, especially in the laundry, in refectories and similar institutions. If, however, the mains were very widely distributed, trouble was sometimes experienced with condensation, and with the necessity for drawing off a good deal of the gas before it could be successfully lighted. Otherwise a gas service of this character, properly laid and carefully designed, was of the utmost possible service. There were, of course, a very large number of types of house, and it was difficult to deal with them all. In many country houses, something in the nature of a home park, or perhaps a horse-breeding establishment, or a dairy, was included in the property. These all made calls on the electrical installation and to some extent on the other installations also.

Where a large estate was concerned, there was generally plenty of space, and the buildings were so far scattered about that it was sometimes preferable to have separate installations for such services as heating and hot-water supply for the buildings where these were required.

Drainage.—The service with which there was commonly the greatest difficulty was the drainage system. It was, of course, generally necessary that the drainage should be wholly independent of any other system. This condition called for septic tank treatment. The drains should be very carefully laid. The latest type of plumbing was even more necessary in a house of this character than a town house, because of the difficulty, expense, and trouble attendant on any repairs, alterations or stoppages that might be necessary. A good fall, and numerous manholes for the proper attention to the drains, were very necessary, and good septic tanks at as great a distance from the house as could conveniently be arranged. Not infrequently considerable difficulty was experienced in obtaining the requisite fall. The drainage system should, in fact, be very carefully thought out.

The design of the house, to some extent, was controlled by the possibilities of drainage. A bad drainage system in a house of this nature was an intolerable and dangerous nuisance, and could only be rectified at great expense and inconvenience.

Heating.—The heating apparatus in a building such as they were discussing might vary very widely indeed according to the size of the house, the conditions of the surroundings and, in particular, the ideas of the occupants. There were persons who would not at any price endure anything in the nature of a central heating apparatus. Such persons, however, were commonly either those who had never experienced the comfort which a reasonably designed apparatus of that character could secure, or, on the other hand, those who had lived in an over-heated house. He could hardly say which he disliked most; a house quite unheated or an overheated one. There was no real comfort to be obtained in either. It was not too much to say, perhaps, that no large house could be kept within the limits of temperature regarded by ordinary people as comfortable, merely by the aid of open fires, without a very large expenditure of labour and fuel. A comparatively small heating apparatus in practically all cases added very greatly to the comfort of a domestic dwelling either large or small, and had extremely few disadvantages, and gave a degree of flexibility and control which, if properly handled, enabled it to satisfy all the requirements of all persons, from the aged and infirm who required a high temperature, to those more robust, to whom any suggestion of stuffiness in the winter was anathema. He did not know any type of building the heating of which needed more consideration than a country house.

In the first place, his view of the functions of a central heating apparatus in a private house was rather to prevent it being a cold house than to make it a warm one. He was persuaded that a warm house in winter was an unhealthy one. He did not in the least believe that changes of temperature between different parts of a house were undesirable, and he was fully persuaded that a warm bedroom was an easy way to make a healthy person into an unhealthy one. At the same time, he accepted the absolute necessity for a person to be thoroughly warm and comfortable when sitting in a room.

Primary Heating.—Branches were taken all over the house. The returns from separate sections were brought back separately. If at any time it was desirable to bring one of these branches into use, the opening of a valve in close proximity to the boiler would enable the heat from the kitchen to be transferred to any part of the house with no labour at all. This was a very great advantage for an ordinary cold summer, such as they had had lately, and indeed at all times, for a combination of a boiler and an oven was not in itself an arrangement economical in fuel. Less fuel would be used if the oven and the boiler were separate and used only when required, but the convenience of having heat, as it were, always on tap was well worth the little bit of extra fuel burnt. The difficulty of installing an apparatus without disfiguring an old house was, he thought, commonly exaggerated.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Raising of Party Wall.

[REPLY TO "J. B." OCT. 10.]

SIR,—"J. B." does not give the situation of the property. In the Administrative County of London there is a statute law regarding party walls; but outside London there is none, though the by-laws which may be made under Section 157 of the Public Health Act, 1875, may affect them.

A consideration of the following may be of assistance:—

At Common Law the wall at rear is a party-wall if either it be a wall of which "J. B." and his neighbours are tenants in common; or, a wall which belongs entirely to one of them, but is subject to an easement or right in the other, to have it maintained, as a dividing wall between the two tenements. If the quantity of land which each of them contributed to the site of the wall is known, the property in the wall follows the property in the land, and each party is the owner of so much of the wall as stands upon his land.

The ordinary and primary meaning of the term party-wall was stated in Watson *v.* Gray (1880, 14 Ch. D. 192) to be a wall of which two adjoining owners are tenants in common.

One tenant of a party-wall cannot maintain trespass against another for injury done to the wall, unless there has been complete ouster, or some destruction of the common property. The whole wall, however, may be destroyed for the purpose of erecting another in its place; though, in Stedman *v.* Smith (1857, 8 E. and B.1), where one tenant in common, after pulling down a building on his side of the wall, increased the height, and built a house with a roof to it occupying the entire width of the top of the party-wall, and also inserted a stone to the effect that it was his wall, it was held that there was an ouster sufficient to enable the other tenant to maintain trespass.

Section 5 subsection (16) of the London Building Act, 1894, defines a party-wall as meaning (*a*) a wall forming part of a building, and used, or constructed to be used, for separation of adjoining buildings belonging to different owners, &c.; or (*b*), a wall forming part of a building, and standing to a greater extent than the projection of the footings, on lands of different owners.

By Section 88 of the Act, a building owner has twelve rights in respect of a party-wall.

No. 8 gives power to cut into a party-wall on making good damage to adjoining premises.

No. 9, to cut away projections in order to build against a party-wall, but must make good damage.

No. 10, to cut away overhanging eaves, &c., in order to build against the party-wall, but must make fresh gutters, &c.

No. 11, to perform any necessary incidental works.

No. 12, to raise a party-fence wall, or to pull it down and rebuild as a party-wall.

With the above in mind, and answering the queries in the order put:—

Query 1.—At Common Law, if it be a party-wall, "J. B.'s" neighbours could only sue him in trespass, where there has been actual expulsion, or acts which amount to actual ouster. If he is excluded from using the top of the wall by his neighbours placing an obstruction thereon, he is entitled to remove the obstruction.

If the property be within the Administrative County of London, and it be a party-wall, then "J. B." has the rights and obligations under the Act above referred to, and need not comply with his neighbour's illegal demand.

If, however, as it appears, there is an easement, then at Common Law "J. B." has no remedy, and is bound to submit to the best terms he can make with his neighbours, for the extinguishment of the easement.

Query 2.—"J. B.'s" neighbours cannot demand access to the gutter from the yard, since it does not discharge over the yard; and he can build as sketch No. 2, since the wall, &c., is on or over his own land.

Query 3.—If built as in Sketch No. 2, the wall need only be the prescribed thickness required by the by-laws in force in the district. If built as a party-wall it need only be the prescribed thickness for a party-wall, when in fact it is a party-wall; for a wall may be in part of its length and height a party-wall and as regards the rest an external wall.

Query 4.—No, if there is an existing easement; but if within London, then the rights above referred to under the Act can be made use of.

"T. P."

[REPLY TO "J. B."]

SIR,—A letter in your last week's number, signed "J. B." and referring among other things to the right acquired by an overhanging gutter, has reminded me of something I was recently told, and which I think may interest some of your readers, and of which I should like to hear some confirmation.

It referred to the back-to-back houses in some districts in the North and Midlands in which it is common to find a narrow gap between such houses, known as the "eaves-drop." Such area cannot be built over, and it is usual to find one small window opening on to it from each house, from which it is believed it was once the practice to throw out slops and rubbish, to the neglect of the most elementary rules of health. I was interested to hear the suggestion that this is the origin of the term "eavesdropping," as these narrow passages lent themselves very readily to the attentions of spies, who could creep up them and overhear conversations through the windows, with little fear of detection.

I should be very interested to hear anything any of your readers can say upon this matter either in correction or amplification.

"BOOKWORM."

[REPLY TO "J. B."]

SIR,—Query No. 1: The adjoining owners have no right to demand anything of the kind mentioned. Their surveyor should be met on the site, and the defects of the existing roof examined. Responsibility for damage arising out of the bad state of repair thereof should be disclaimed. The work on the gutter should be executed with the utmost care, and the roof left watertight so far as disturbed by the alterations. It will, of course, be necessary to serve the necessary party-wall notice upon the adjoining owner.

Query No. 2: The wall being admitted as a party wall, the "right" of access to the gutter is "J. B.'s" own right, and it is quite unnecessary to go to the expense of the work indicated on the sketch (No. 2).

Query No. 3: The wall may be raised of the minimum thickness required by the local by-laws, and if subsequently used by the adjoining owner in raising his own premises, a proportion of the present cost of raising will be recoverable from him.

Query No. 4: Yes, provided the necessary notices have been served, and the wall passed as fit for raising, but the adjoining owner may apply for an injunction to restrain pending litigation. He would, however, be very ill-advised to do so on such a slight case. "J. B." will probably find that it is largely a matter of "bluff."

"CAST IRON."

Abandoned Work.

[REPLY TO "SURVEYOR." OCT. 17.]

SIR,—"Surveyor" has, apparently, not quite "got" my question. I know perfectly well that it is often necessary to take off c in order to obtain tenders, and tha practice saves much duplication of labo part of contractors, but I do not know these facts may be taken to be comm ledge, or whether it is necessary t a client thereof at the outset, in ord able to claim quantity fees in the eve work being abandoned. The bare s does not quite satisfy me. It might b correct to say that it is necessary t prints of drawings, in order to obtain but it would hardly be upheld that the could claim the cost of these in like stances. The cases are not quite para this is merely an instance in which the is put to necessary expense which ca recovered.

"BIT

[REPLY TO "BITTEN." OCT. 1

SIR,—The point to be decided is wheth was an implied instruction to the archit quantities should be taken out in this ca general, an architect has no implied auth employ a quantity surveyor, or to act himself; such authority must be given e by the employer. It has, however, bee where works are of such great magnitude is impracticable for contractors to tende factorily without the aid of quantities, an the contractors expected such aid as a m custom, that such authority was implied instructions to the architect to invite te and any claim for fees for preparing quan further supported if the employer knew quantities had been taken out, and were made use of, and he had actively or acquiesced to the fact. In Lansdowne *v.* S ville (1862, 3 F. & F., 236) the jury foun there existed a local custom according to architects took out quantities for works that therefore the employer both knew custom and contracted on that footing. a later case—Antisell *v.* Doyle (1899, 2 I.R an Irish case—the jury found, in similar c stances, that no such custom was recogni the district, and that the employment w within the scope of the architect's authorit sanctioned by the employer, and the arch claim was disallowed.

Therefore it would appear that "Bitte order successfully to uphold his claim f full fees must prove that the custom of tects taking out quantities for works magnitude of that abandoned exists in his and was "common knowledge" accessible employer, or that the employer knew th quantities were being used for the purp obtaining tenders, and that therefore his c for his services was made on that footing of course, if the employer had been an authority, not an individual, and th claimed exceed £50, he must have a contract.

"T.

[REPLY TO "BITTEN."]

SIR,—In certain districts it is no common practice to take off quantities purpose of obtaining tenders, but for v over £1,000 value it is practically imp to obtain them otherwise from firms standing. In such cases the architec take instructions to obtain tenders to the adoption of such means to that en are the custom in the district.

It is, however, always wise to mak that a client understands what his instr are involving him in, and it is fair to tell him in advance that quantities wi to be taken off and that the fees there be included in the contract, but will be able to him in the event of the wor abandoned.

"FOREWAR

[REPLY TO "BITTEN."]

SIR,—"Bitten" may rest assured definite, an undisputed instruction to tenders—tenders which cannot be unless bills of quantities be prepared—

ite chippings and cement. While
dry chippings of granite should
be dashed on to the surface, and this will, I think, give the result at which "Stucco" is aiming.

"GRANO."

Estimating Quantities.

[REPLY TO "QUANTITY SURVEYOR," Oct. 10.]

SIR,—The allowance for waste, &c., varies with different trades and materials. The items mentioned by your correspondent will require the following allowances, on the authority of that very excellent work, "How to Estimate," by J. T. Rea—a work your correspondent would find of great use to him:—

Brickwork, 2½ per cent. Flooring, 10 per cent. Tiling, 2½ per cent. for tiles, 5 per cent. for laths, nails and plugs.

The item for brickwork is based on the figures that 1 cubic yard of brickwork requires 380 bricks nett, and 390 bricks gross.

"SUPER."

Traction Drive.

SIR,—I should be obliged if you would inform me through the medium of your "Inquiry Bureau" as to the minimum "turn" required in a drive for a carriage and pair, and also for a large motor car.

"BERKS."

Made Ground.

[REPLY TO "NERVOUS," Oct. 17.]

SIR,—I know of a large building in the City, consisting of basement, ground, and four floors, that was built on poor ground upon a concrete raft calculated to spread the weight thereon to lead the ground up to one ton per ft. super. I forget if the ground were made or not, but remember it was pretty poor stuff. The building referred to is still standing and without a settlement crack in it.

My personal opinion is that "Nervous" may safely change his *nom de plume* to—

"CONFIDENT."

Wire Bells.

SIR,—Could any of your readers inform me of what metal, good-toned, wire house-bells should be composed? This class of bell is so seldom used nowadays that it is difficult to obtain reliable information about them.

"OLD FASHIONED."

[If "Young Builder" will send his name and address, not for publication, we shall be glad to insert his inquiry.]

Central School of Arts and Crafts.

IN his third lecture at the Central School of Arts and Crafts, recently, Sir Banister Fletcher gave a description of the structural principles of Gothic cathedrals, more especially in regard to the building-up of their "vaulting," or arched stone ceilings, their buttresses, to resist the thrust of such vaults, and their flying buttresses, to bring the pressures of the high vaults down across intervening roofs to the outer edge of the buildings. These features, originally purely scientific in their purpose, came to be designed in such a way as to combine æsthetic values with the constructive ones, and have thus thrown a glorious mantle of elaborate vaulting and framework over these mediæval churches. The weight of a building was now, instead of being distributed over solid walls, as in earlier periods, concentrated on isolated supports, thus leaving free spaces for vast coloured windows. So far from the immense blocks of masonry used in Egyptian and Greek times, only small units of rough stone were now usually obtainable, and this evolved a totally different method of building. Building thus became an experimental science of effectively balancing small stones on one another, thus producing a new principle of lateral thrust and counter-thrust. The old Roman building stood solid on the ground; the Gothic structure soared lightly into the air. Thus the Christian cathedral of Reims, in all its panoply of lacework panels, statues, portals, and windows, was borne aloft by pier and buttress at a tremendous height.

BOOK REVIEWS

Small Family Houses. By A. RANDAL PHILLIPS. (*Country Life* Office.) Price, 10s. 6d.

To those desirous of building, and in doubt as to the style of house required, this should prove a welcome volume, containing, as it does, numerous examples of houses ranging in cost from one to four thousand pounds. With few exceptions, all are illustrated from photographs from the actual buildings. The types illustrated are well chosen, and the various plans are skilfully and compactly schemed, avoiding all waste space. We welcome the disappearance of the lounge hall in small houses, at one time such a feature, usually provided at the expense of the living rooms; the ingle nook is also a thing of the past. The various elevations are well proportioned, and devoid of unnecessary ornament; whilst the treatment of the materials used is properly recognised. The interiors illustrated are simply treated, and restful in appearance. The practical side is not overlooked; numerous up-to-date labour-saving devices are shown, so essential in these servantless and self-help days. The old dirt-catching open dresser has disappeared in favour of the glazed. Through the necessity of economy, many difficulties have been overcome in house-planning to-day, which at one time would have been thought impossible. This is to the credit of our architects, who have given these matters close study. The gardens have also been laid out in a practical manner. The book concludes with a chapter on choosing an architect; in this, much sound advice is given.

Aspects of Houses in Relation to Wind, Rainfall, and Sunshine. By NATHANIEL LLOYD, R.I.B.A. 1924. Price 2s.

The author's object is to show us that aspect is a more complicated affair than many of us suspect. He points out, for example, that dressing and breakfasting in the sun are not consistent with adopting the normal south aspect, and that it is unwise to place one's house to face the prevailing winds and storms. In illustration of his points he takes a plan with a flat "garden front," containing all the living rooms and bedrooms and shows the effects of placing such a front at various angles. The diagrams are valuable so far as they go, but they take no account of the illumination from windows not on "the front." Now the morning sun is clearly desirable in a dining room, but if this house faces due south the side window can give the dining room the east sun as well as the south sun. The truth is that each house should be designed to suit its own site, and Mr. Lloyd has done well to show that we must not blindly build our houses to face south without inquiring into the other factors—wind, rainfall, and local peculiarities. After careful consideration of the pros and cons of the various aspects the author fixes upon the south-east as the best of all aspects. But a room that faces south-east is still better if it has another window facing south-west. The pamphlet contains some tables showing the average hours of bright sunshine at different stations and these tables all go to disprove the author's contention that "most of the records indicate more bright sunshine in the morning than in the afternoon." In these tables the sun after midday is in every case an easy winner.

THE BUILDING TRADE

ESTIMATING FOR SMALL BUILDERS

By J. H. BARNS, F.I.O.B.

PAINTER, &c.—*Continued.*

Washing off Ceilings and Distempering.

The cost to wash off ceilings would be from 1d. to 6d. per yard super, and will in a measure depend upon whether the ceiling is washed off right back to the plaster or only the dirt washed off and the old distemper left on. It would also depend upon whether it is a common distemper composed of size and whiting or it is one of the proprietary distempers, which will be dealt with later. If only the dirt is washed off it may be necessary to bind down the old distemper with a coat of size or claircolle. The washing off is done with brushes and water. Sometimes hot water mixed with some solvent is used to expedite the removal of the old distemper. The ordinary distemper is composed of whiting, size and a little stainings.

Common work can be sublet for labour only at 1½d. per yard, including use of brushes. For ordinary plain work it is worth from 4d. to 6d. per yard.

Yds.

— sup. Washing off and twice distempering ceilings (common work).

Materials.

	Per cwt. s.	d.
Ball whiting	3	6
Gilders whiting	3	6
Powdered whiting	3	0
Size (jelly) extra double	11	6
„ „ treble extra	15	0
„ „ patent transparent	23	0
Concentrated size powder	90	0
„ „ „	70	0
„ „ „	60	0

Example :—

For 100 yards.

	£	s.	d.
21 lb. whiting			9
1 lb. blue			6
7 lb. size		1	0
Scaffolding, &c. say		3	0
Use of brushes „		3	0
Labour, washing and distempering (see above)	2	10	0
	£2	18	3
Profit and oncosts, 15 per cent.		8	9
For 100 yards	3	7	0
For 1 yard			8

Washing Off and Distempering.

If washing off and distempering are done to walls instead of ceilings, the cost would be similar but as the walls are usually finished to some definite tint a little extra must be allowed for this. In distempering on old work, after the washing off has been done, it is usual to apply a thin coat of size and whiting called claircolle to bind down the old work and this would take the place of one of the coats of distemper, unless otherwise specified. It would cost about 10 per cent. extra over the cost of common distempering to ceilings, for distempering plain cornices. If the cornice is elaborate or enriched the cost would be higher. If ceilings above 12 ft. high, something must be added for increased cost of scaffolding.

Distempering Walls and Ceilings with Washable Distemper or Washable Water Paint.

These are supplied in paste or powder form and have to be thinned out to the required consistency with fluid usually called petrifying liquid.

The price of the distemper differs with the tint to which it is supplied. The prices of the materials and the approximate covering capacity can be obtained from the makers. There are two qualities supplied, one for inside work and the other for outside. In cases where an alteration of tint is required other than that possible by intermixing standard shades of the proprietary article, the manufacturers will supply special stainers at prices varying from 1s. to 3s. per lb., according to colour.

Water paints are usually of an open, porous nature, which allows dirt to get into the structure and this gives a streaky appearance when washed.

Example of Cost :—

	£	s.	d.
1 cwt. water paint (60s.)	3	0	0
3 galls. petrifying liquid (4s. 2d.)		12	6
For 300 yards super	£3	12	6
For 1 yard super			3
Labour			4
Scaffolding say			½
Use of brushes			½
			8
Profit and oncosts, 15 per cent.			1½
Per yard			9½d.

Removing Washable Distemper.

Washable distempers if applied in accordance with instructions are usually quite washable, and in fact they are very difficult indeed to wash off. When commencing to re-distemper a wall previously treated with washable distemper, it may be found that the work which has been re-distempered on the old material after a time flakes, probably due to the contraction of the old material underneath, so that the only way to make a satisfactory job of the work is to remove the old washable distemper, and this is a very difficult operation unless some kind of paint remover is used, and some of the makers of proprietary distempers are selling paint remover for the purpose, the usual price for which is 7s. 6d. for a 14 lbs. tin, and this would cost about 3d. per yard for material, and to apply to old distemper to remove the same labour would be about 3d. per yard.

"Stoppon."

When the washable distemper has been removed from the walls, it is sometimes advisable to give the surface a coat of "Stoppon," at 14s. per gallon, which will cover from 100 to 120 yds. super., and would take the place of the ordinary claircolle.

Stippling.

Distempering is sometimes specified to be finished with a stippled face, which is worth about 1d. per yard additional. Stippling obliterates the brush marks left by the distemper-brush, and seems to give a denser surface to the work.

Water Paint on Woodwork.

For unimportant work of an urgent nature, water paint is sometimes used for painting woodwork, as it dries quickly, and two or three coats can be applied in a day. The finishing coat should be an oil paint or varnish, as water paints are porous.

Wall Papers.

Before hanging wall papers, it is usual to apply a coat of size to the wall to stop the suction of the wall plaster, and this is worth 1d. or 1½d. per yd. A better method, when time will allow, is to apply a coat of raw linseed oil to the plaster, as when dry it is like a coat of paint and tends to stop the plaster causing the colours on the wall paper to fade. It would cost 3d. or 4d. per yd. for labour and materials. Some people use a thin paint composed mainly of white lead and turpentine for this purpose. The turpentine evaporates, leaving the white lead adhering to the surface, and this is usually rubbed off before applying the next first coat of such material is therefo value.

Hanging Papers.

The cost of hanging wall papers is f per piece upwards, the better qual requiring greater care in trimming an For cheap work the papers are tri edge and lapped the other, but for both edges are trimmed and butte papers have a tendency to shrink afte is applied, leaving a very ugly joint; may be minimised by previously lini with a tinted lining paper. Borde papers are worth about 1½d. per yd.

Writer.

The cost will, in a measure, depend quantity of work to be done, as if the one name to be written, say, on a doo of going to and from the job must b The prices given, therefore, can only as approximate. For writing on doors lar sort of work the cost would be 8d. inches up to 4 in. high, either painte or colours. In measuring the letters, only is taken, and, as an example, seen that six letters 2 in. high wo a dozen inches, or four letters 3 in. h cost as much. This price is for all types of letter. Fancy or ornament would be additional. If the letters wa the cost would be roughly double sa per dozen inches. In the case of comp large signs, these could be written fo dozen inches, and gilding double. prices must be added cost of scaffol attendance, if any.

Kingsway and Aldwych.

The London County Council recei sidered the lease of the island site in th The lease of the site had been let fo nine years to the Bush Terminal Comp a progressive scale of rent, the ultimate £55,000 a year being agreed to in Octo The company had written the Counc that it had come to the conclusion th existing economic conditions, it was i able to proceed, as intended, with the ment of the remaining two wings on of the existing apportioned ground r Improvements Committee of the Cou that they had come reluctantly to the that they had no option but to recon Council to determine the building a estreat the deposit of £35,000, and to obtain new offers for the letting o as a whole or in plots. A recommen this effect was carried.

Bombay Development Schem

A booklet has just been issued Bombay Development Department. that when the various schemes in ha viding sites for high-class residences a Bombay will have more room to spre she is likely to need for years to con supply catches up with the deman course of time overtakes it, it is hope fall automatically. The scheme p building 163 blocks of 80 single-ro ments each, or a total of 13,040 which may be converted into two-ro ments if desired. The construction is of concrete reinforced with steel. of building these tenements has been tised that the rate of progress is equi output of one block of 80 tenements A large area of swamp land just b buildings is being reclaimed, and w laid out as a park for the benefit of and their children. The industr schemes on which work is now go shortly to begin, will altogether pr tenements which, allowing five including children, for each, will affo dation for 250,000 persons.

NICAL EDUCATION ND BUILDING

Manchester Conference.

D by an informal committee of chers in the N.W. area, a conference education was held at the Manchester Technology, on October 18. This rth of a series of what have now ual meetings held in this area. The as attended in the main by teachers a wide area, but there were also ne members of the Institute of rincipals of technical schools, and sted in this question. Considerable ttended recent attempts to improve and to widen the scope of the provided in technical schools for and others in this industry. Since e have been increases in the numbers r instruction in several parts of the

Pearson (Preston) reported on the a small joint committee which was ar ago, consisting of a number of s of the Manchester Branch of the Builders and a number of building Ie referred to the discussion and establishment of a number of rses" in the area, which were meet the needs of the less ambitious entice, being less wide in scope and in character than the normal course the work of the industry as a whole. t with the progress which had been setting up of a scheme for that area awards to building students in the ed classes, those awards to consist ver and bronze medals, and also of ds—the former having been given tute of Builders, and the latter by d Master Builders of Manchester. outlined the draft scheme which had l, and expressed the hope that little now occur in the final acceptance of by the various educational bodies

Drury, M.Sc., dealt with the need for posts of responsibility in the Ie outlined the changes which had place in the industry in recent years n in the number of large building ncreasing complexity and size of dings, changes in the methods and ed, and, generally, the increasing he problems with which the modern o deal in the control of large estab- l in the execution of large contracts. led to create a demand for well- , having a sound foundation of owledge and practical experience. it had led to greater attention o the problems of administration In this connection, he welcomed of some reference to this topic ce examination recently instituted ite of Builders. While they might with the exact form in which the een included in that examination— l to over-emphasise the importance e work of book-keeping—still he would all agree that the institution nation had given importance to the e problems of administration and oped that when changes were next details of those examinations, e closer co-operation between the the schools, and that greater ould be given to the great need nd technical improvements within The complete treatment of those ld only be possible if the instruc- intended to occupy important the industry could be carried ge to which it could be developed cal schools, and that it might ntages which came from its treat- he walls of a university. A frank discussion of the whole problem and he was glad to know that the Institute of Builders had already taken some steps in that direction.

Mr. W. F. Anderson dealt with the subject of trade courses. He said this development was an experiment. Its success depended most upon the support which the industry might give in the way of sending their apprentices to attend those courses. The courses had been established in order to meet the criticism that the usual building course was too difficult for the average apprentice. Such specialisation in the provision of instruction meant a division of the groups of students they had to deal with; it was only possible with largely increased numbers. Apart from this, it was no doubt sound to arrange that the apprentice who was keenly interested in his trade should have the fullest opportunity possible for developing his skill and knowledge in it. At the same time, they must safeguard the interests of the more capable apprentice, who might with advantage extend his studies beyond the limits of his trade; this he could do in the general building course. He believed that the arrangements they had made in that area would secure those points, and it was now for the teachers and the industry to give the scheme a fair trial.

During the discussion it was suggested that the effect of the institution of those simpler courses would be to improve still further the work which it was possible to do in the main course for builders, and in addition those trade courses might form a suitable basis upon which to build the special intensive courses which in all likelihood they might be called upon to set up to deal with the present emergency.

A paper on "Building Examinations," which was read by Mr. J. W. Riley (Rochdale), and which was, in effect, a summary of a paper which he read recently before a joint meeting of the Institute of Builders and Building Teachers, held in London last July, showed in a concise way that nearly all the problems which had been discussed at the meeting, in so far as they related to education, eventually took the form of the establishment of suitable conditions in which the teachers could prosecute their work and the students develop their knowledge and experience. Mr. Riley sketched the recent history of the provision or absence of technical examinations for building students. He referred to the excellent local arrangements which they enjoyed in Lancashire and Cheshire in this respect, but suggested that they should not rest content until their own and other local schemes, however satisfactory they might be, were linked up by some form of national examination in building, which had both the approval and the support of the industry and also of the education authorities and the Board of Education. He referred to the recently instituted national examinations which had been set up jointly by the Board of Education and various professional bodies representing some of the other great industries.

Mr. Scholes Hague, of Liverpool, during the discussion that followed, mentioned the great service which had been rendered to technical education by the establishment of national examinations of the type to which Mr. Riley had referred; he also mentioned that, in Liverpool, they had been able to make considerable progress in the matter of building education in the past year by the establishment of a joint committee, consisting of employers, operatives, and the education authorities.

Mr. Walter Thorpe, F.I.O.B., supported the idea of the introduction of national examinations in connection with building, from which nothing but good could result to the industry. He was sure that the Institute of Builders would be quite prepared to do their share to help forward such a desirable movement.

A Wireless Set.

[This wireless set consists of an "Ethophone" instrument, made by Messrs. Burndept, Ltd., Bedford-street, W.C., standing on a cabinet containing the batteries and loud speaker.]

MASTER PAINTERS' COMPETITION

We give below the conditions of this competition :—

(1) The scholarship is open to apprentices who have completed or are in course of completing the terms of their apprenticeship with members of the National Federation of Master Painters and Decorators of England and Wales, the National Federation of Master Painters of Scotland, and the National Association of Master Painters in Ireland, and to the sons of members.

(2) Competitors for the scholarship must not be more than 25 years of age on August 31 preceding the competition in which they take part, and must prior thereto have been candidates at one or more of the annual competitions for apprentices promoted by the three contributing bodies.

(3) Each competitor is required to sit for a compulsory qualifying examination on a date to be fixed by the committee, not less than six months prior to October, 1925. Only such competitors who satisfy the examiners will be allowed to complete their works for the scholarship examination.

(4) Competitors who have successfully passed the preliminary examination will be required to submit to a further written examination, and complete practical tests as specified on dates as fixed by the committee.

(5) Competitors will receive from the committee not later than March 1, 1925, full instructions regarding the further testimonies of study required from them. One month's notice will be given to each competitor of the date on which the completed works must be delivered to the committee.

(6) All works submitted in competition for the scholarship will be retained for exhibition at the annual conventions of the three contributing bodies, following the receiving date and for such longer period as the committee may determine. No responsibility for damage or the safe custody of any or all of the works submitted by competitors will be accepted by the committee.

(7) The committee reserves the right to withhold the award of the scholarship if, in their opinion or that of the examiners, no competitors reach the required standard.

(8) The successful competitor will be required to submit an itinerary of his proposed tour to the committee, who may vary it at their discretion. The competitor must undertake to abide by the committee's decision. He shall also be required to produce and hand over to the committee coloured drawings and other studies of decorative work as the committee may determine and require.

(9) The committee may terminate, cancel or withdraw any scholarship if they consider that the work, conduct or character of the holder of the scholarship is not satisfactory, and the decision of the committee on these points shall be final.

The preliminary qualifying examination will consist of :—(1) A test of the competitors' knowledge of architecture and colour. (2) The setting of a test in applied ornament and colour.

The scholarship examination will consist of :—(1) A written paper (under examination conditions) on some aspect of decoration. (2) A panel of painted ornament (prepared under examination conditions).

The submission of testimonies of study to include :—(*a*) Measured drawing mounted on card size 30 by 40, showing the modern tendency of design in architecture for public buildings. (*b*) Coloured designs for the decoration of an existing building. The competitor to prepare measured drawings and submit perspective sketch and photos of the actual building (instructions will be given by the committee as to the type of building). (*c*) Three sheets of studies at the competitor's discretion (mounted on card). These must include one showing heraldic decoration in colour. (*d*) Sketch book. The competitor is required to include actual studies of architectural details, decoration and fitments, drawn direct from the object with place and date of sketch given. Drawings made from printed copies will disqualify the competitor.

Trustees : Messrs. J. Higson (England and Wales), J. M. Orr (Scotland), J. Sibthorpe (Ireland). Chairman : Mr. J. Sibthorpe, National Association of Master Painters in Ireland. Hon. Treasurer : Mr. J. W. Sellars, National Federation of Master Painters of Scotland. Committee.—England and Wales : Messrs. R. Barker, R. Brown, J. H. Cantrill, A. Campbell. Scotland : Messrs. D. Colquhoun, W. H. Cameron, J. Scott, J. W. Sellars. Ireland : Messrs. J. Sibthorpe, J. Tetlow (Original Founders). Secretary : Mr. W. Mellor, 9, Albert-square, Manchester.

FURTHER ADVANTAGES OF THE NEW STEEL JOISTS.—II

By M. B. BUXTON, A.M.Inst.C.E.

In an article published in the last New Year's Number of *The Builder* it was pointed out that there were marked advantages to be derived from the use as beams or girders of the new 1920 range of steel joists instead of the older range, which many engineers and architects have not been slow to appreciate.

Besides beams there are of necessity a considerable number of stanchions or pillars in every large work, and it will be shown in this article that similar advantages accrue from the use of the new 1920 sections rather than the old for this purpose.

This question is not nearly so simple, for the theory of the strength of pillars or stanchions is an extremely complicated mathematical problem, nor are practical data sufficiently available to form a generally accepted simple formula.

In designing a stanchion, when the load to be carried has been calculated, we have to consider several matters before a suitable section can be chosen. We must decide upon the material of which the pillar is to be composed. This in most cases is mild steel since cast iron is hardly used at all at the present time for building purposes. Then we must consider as to how securely or otherwise the ends are fixed either to grillages or to beams, and whether any allowance must be made for eccentric loading. But the deciding factor in our choice is generally the "slenderness ratio," by which we mean the quantity found by dividing the length of pillar in inches by the least radius of gyration in inch units of the section. The least radius of gyration for every section is tabulated in the various makers' handbooks and is derived from the relation between the area of the section and its moment of inertia.

There are numerous formulæ in use for stanchion design, but those most general in this country are the London County Council's, Moncrieff's and Claxton Fiddler's.

The permissible stress per square inch of section for various values of the slenderness ration has been calculated by these various formulæ and is published in the form of tables for general use. For instance, the L.C.C. value for a slenderness ratio of 100 for a stanchion with fixed ends is 4 tons per square inch, for 200 is ·5 ton per square inch. Multiplying the appropriate value by the area of cross section of the pillar we have the permissible safe central load which can be carried on a stanchion, and we can then finally decide if our section is suitable.

All joists are stiffer in the plane of the web than in the other, and yet a stanchion has to be designed to resist buckling due to a given load along its weaker axis, which means that the least radius of gyration governs the situation. Since the permissible stress per square inch increases as the slenderness ratio decreases the importance of increasing the least radius of gyration is obvious.

It is equally important in stan that the ratio between the greate radii of gyration should be as smal Take, for instance, a 9 in. by 4 i joist of the old range of sections radius of gyration 3·6 and least ·8. of 9 ft. by Moncrieff's formula, th 22 tons with " ends flat " as a stan compare a 1920 section, the 5 in 20 lbs., with maximum radius of and least 1, and under the same carries 32 tons, though it is a light the case of the 9 in. by 4 in. at 21 the ratio between the radii of while in the case of the 5 in. by 4½ it is 2, and so the latter joist is section to use as a stanchion. that the broad and compact joist to aim for as an economical stanch

Now these scientific facts were of those responsible for the design range of sections, and they have greater number of joists with broa act as stanchions, and have in increased the least radius of gyr better disposition of metal.

We have the 4 in. by 3 in. at 10 4½ in. at 20 lbs., 6 in. by 5 in. at by 6 in. at 35 lbs., and though thes in size to the old range the ratio radii of gyration is decreased so th capable of bearing greater loads t joists and so are more economical.

The 9 in. by 7 in. at 58 lbs. and t 8 in. at 70 lbs. of the old range are to 50 lbs. and 55 lbs. respectively. render them of more general use building work as the old sections wer to be greatly used and had too in the webs to make economical stanchions.

The most marked changes are in t joists of the old range : 12 in. by 6 14 in. by 6 in. at 57 lbs., 16 in. 62 lbs., and 18 in. by 7 in. at 75 have now been improved by g broader flanges, in every case 8 in. 6 in., and so we find 12 in. by 8 in. 14 in. by 8 in. at 70 lbs., 16 in. 75 lbs., and 18 in. by 8 in. at 80 lbs.

For the reasons explained above, compact joists can carry from 25 40 per cent. heavier loads than t For instance, the permissible cent the 12 in. by 6 in. at 54 lbs. old joi length, when calculated by the L.C is 67 tons. The new 12 in. by 8 i will carry a load of 93 tons unde conditions, which is an increase 40 per cent.

These larger joists can be used as stanchions where formerly it been necessary to use a compoun formed by riveting plates to the joist. The increased weight of th and the labour of riveting the p flanges much increased the cost of stanchion when compared to a stanchion.

When we come down to smal details it will be plain to those w much experience of stanchion des deep webs and the broad flanges advantages for supporting the en girders. If a specially strong necessary we can have, with these not only a stiff bracket to rest t and a top cleat, but also a pair on the girder which will greatly s connection.

It cannot be too strongly emp these sections are now general The Steel Rolling Mills are rol sections, and almost all the steel country roll several, while one a large selection. Many constr neers have considerable stocks a and engineers who know where to advantage will find they have in getting these new sections derive a considerable benefit.

NEW BUILDINGS IN LONDON

.—Hospital.—Tenders are being om selected contractors for the f the West-Park Mental Hospital n County Council Mental Hospitals This institution has already ut £1,000,000 on its building and nd it is estimated that £105,000 is mplete the scheme. The buildings cted are additions to the infirmary, rds. a new chapel, &c. The archi- Clifford Smith, the Committee's he quantity surveyors are Messrs. Neighbour & Nicholson, 55, Chan- .C.2.

lith. — Housing. — An important me is to be carried out at Hammer- e the Trustees of the Peabody nd have bought a site of about four proposed to build 33 blocks of five containing self-contained flats of nd four rooms, together with 58 ive rooms each. The flats will be ll labour-saving devices, gas ranges &c., whilst the cottages will be of type. New roads and sewers and services will be constructed. The Mr. Victor Wilkins, of 12, York delphi, W.C.2. The contract for f the work has been placed with ter Lawrence & Son, Ltd., 19, nare, E.C.2, who have just started site.

treet. — Extension. — The Old reet Infirmary, S.W.1, owned by the Council, is to be leased to the ospital, who propose to adapt the n annexe. Being in a bad state of uildings will necessitate complete decoration, and new equipment, £20,000. Of this sum about £8,500 ended on general repairs and the be used for adaptation works, stallation of adequate heating and ms. The plans have been approved Council as lessees. The architects Young & Hall, of 17, Southampton- l.

re. — Cinema. — The Tottenham Entertainment Co., Ltd., of the ace-grove, London, N.17, are con- he erection of a new hall in Bruce- s by Mr. A. P. Lloyd, 7, New- oln's Inn, W.C.2, provide for a one- g for dances, meetings, &c., accom- out 5,000, and the contracts will be o tender very shortly. They have of erection a smaller hall to accom- 0, the contractors being Messrs. nt & Son, 16, Bruce-grove, N.17. ns in connection with the "50–50" rdour-street, W., the contract has with Messrs. Arthur & Pirkis, Ltd., reet, S.W., who have just com- ations.

-Hospital.—The London County uly approved the preparation of quantities, &c., for the modernisa ght large three-floor blocks at Ban- Hospital. It is proposed (1) to "J" into a two-ward block by of one story to the existing end- d the re-distribution of dormitory on on the ground and first floor; nvert block "K" into a three- by the addition of two stories to room, and the re-arrangement of y accommodation on all three proposed alterations necessitate a rease, ward sculleries, boot rooms, ry accommodation, &c., and an will be made in the size of the the better lighting of the wards. l cost of the alterations is £30,265. ve been prepared by Mr. Clifford I.B.A. (L.C.C. Mental Hospital ociated with Mr. Leolin C. Gregory,

eet.—Offices.—Work has started l section of the new premises on the corner site in Gresham-street and Coleman-street, E.C. 2, of the Swiss Bank Corporation, Ltd. The new building will be of five stories, the two top ones being contained in a "Mansard" roof, and two basements. The foundations are composed of reinforced concrete. All the floors will be of hollow tiles reinforced with steel bars. The elevation will be executed in Portland stone, the ground floor being of polished granite. Marble and hardwood panelling will be extensively used in the decoration of the banking hall and principal offices on the ground floor. The sloping roof will be slated with Cumberland slates and finished with a flat of concrete surfaced with asphalte. The window casements will be of bronze on the ground floor, fitted with rolling shutters. The other windows will be of steel. An artesian well will provide a private supply of water to the building. Extensive strong-rooms will be found in the basement. The architects are Messrs. Meakin, Archer & Co., of 73, King William-street, E.C.; and the builders are Messrs. Ashby & Horner, Ltd., of 8, Aldgate, E. 1.

Regent-street.—Shops.—Another 50 ft. frontage of Regent-street—Nos. 91 & 93—is about to be rebuilt. Plans have been completed for a block of six stories, to consist of two large double-fronted shop fronts on the ground floor and five floors of office accommodation above, approached by a separate entrance. One story will be contained in the Mansard roof. A basement will necessitate excavation to about 20 ft. The building will have an elevation conforming to the Crown scheme of reconstruction, faced with Portland stone. A steel frame will carry all the principal loads, whilst the floors will be of some fireproof material. The shop fronts will be of bronze with marble skirtings and linings and art metal decorations. The roof will be covered with Cumberland slates. Systems of heating and lighting will be installed throughout the premises, whilst a lift will serve all floors. The architects are Messrs. Yates, Cook & Darbyshire, of 43, Great Marlborough-street, London, W. 1.

Ilford.—Hall.—It is proposed, as a local war memorial, to build a small hall at Ilford, Essex. Plans have been prepared for a circular building, measuring about 30 ft. in diameter. The hall will have a domed roof, constructed of reinforced concrete, with steel bars. The walls will be of brick, faced with Portland stone and red brick. The architects are Messrs. C. J. Dawson, Son & Allardyce, of Clock House Chambers, Barking, Essex.

Carshalton.—Houses.—A housing scheme is being carried out at Carshalton by the Carshalton Housing Co., Ltd., of 10, Lower Grosvenor-road, S.W. 1. About 70 houses are to be built, each containing living room, kitchen, scullery, bathroom, lavatories, &c., and three bedrooms. Each house will have a 30 ft. frontage on a new road to be constructed, and will extend back for about 150 ft. Sewers and other public utility services will be laid on. The contractors are Messrs. J. Cracknell, Ltd., of Huntley-grove, Peterborough. The plans have been prepared by Mr. Arnold Mitchell, of 17, Hanover-square, W. 1.

Golder's Green.—Extension.—An adjoining vacant piece of land will be purchased by the owners of the Ionic Cinema, at Finchley-road, Golder's Green, N.W. 10, with a view to extension. It is proposed, at an early date, to considerably enlarge the auditorium and galleries, and to build an up-to-date tea and refreshment room. The architect is Mr. J. Stanley Beard, of 52, Baker-street, London, W. 1.

Streatham Hill.—Flats.—A large row of flats is to be built on the Leigham Court Estate, at Streatham Hill, S.W., for the Artisans', Labourers' and General Dwellings Co., Ltd., of 1, Cromwell-road, South Kensington, S.W. There will be 34 flats in all, and each one will consist of living-room, kitchen, scullery, bathroom, and w.c., and two or three bedrooms. Facing bricks will be used for the street frontage, whilst the interior equipment will include cooking ranges with hot-water boiler, grates, and electric-light fittings. The general contractors are Messrs. Walter Jones & Sons, Ltd., 64, Victoria-street, S.W. 1; whilst the plans were prepared by the Dwelling Company's own architect.

Chelsea.—Shops.—The large site at the corner of King's-road and Vale-avenue, Chelsea, S.W., is being developed by the erection of a row of some 17 or 18 shops with showrooms and dwelling accommodation above. At the end of the row, adjoining Vale-avenue, there will be a new branch for Messrs. Barclays Bank, Ltd.; whilst at the other end will be a modern restaurant and café. The elevation will be carried out in good quality facing brick, relieved by stone dressings. The general contractors are Messrs. R. Dixon & Sons, Britannia Works, Park-walk, S.W. 10; whilst the architect is Mr. G. W. Booth, of 45, Chandos-street, W.C. 2.

Croydon.—Additions.—It is hoped to complete the working drawings by the end of this month for the new additions to the Croydon General Hospital. Funds are now in hand in order to enable a start to be made of the first portion of the plans, the total cost of the complete scheme being £250,000. The first section provides for a new out-patients' department, a new block for two wards, and additional bedrooms for the nursing staff. It is estimated that this section will cost about £36,500. The entire scheme includes a ward block for 12 beds, an extension of present wards for 28 beds, a small recreation hall for use as a chapel on Sundays, with a large operating theatre above it. A paying patients' block to accommodate 30 patients in small wards and single-bedded rooms is also to be provided. The architects to the hospital are Messrs. H. Berney & Sons, of High-street, Croydon.

Pancras-street.—Buildings.—Extensive buildings are to be erected on a site in Huntley-street and Pancras-street, W.C. 1, for the Royal Ear Hospital. A four-story block, covering a ground area of 7,500 ft., is to be built at a cost of about £45,000. The hospital will be constructed of brick on a steel frame, with Portland stone dressings. On the ground floor will be an out-patients' department, writing-room and lavatories, operating theatre, dispensary, and consulting rooms. On the first floor will be a board room, private patients' wards, bathrooms, men's wards, duty-rooms, &c. On the second floor will be a women's room, matron's room, lavatories, &c.; whilst on the third floor will be children's wards and operating theatre, dressing room, &c. A basement will also be fitted up for radiography, examination rooms, &c. The architects are Messrs. Edmund Wimperis & Simpson, of 61, South Molton-street, London, W. 1, acting on the instructions of Mr. Geoffrey Duveen, the chairman of the Hospital, who is erecting the Hospital as a memorial to his late father.

The Surveyors' Institution.

Prior to delivering his presidential address at the opening meeting of the Institution session, at 8 p.m., on November 10, Sir Edwin Savill will unveil the portraits in oils of the Rt. Hon. G. F. Stewart, P.C., and Mr. J. I. Davidson, the two first Presidents respectively elected from the Irish and Scottish Branches of the Institution.

During the earlier part of the session, Mr. L. E. Tanner will read a paper, on January 12, 1925, on "The Building of the Abbey Church of Westminster."

The Council has set up a special committee to consider and report upon the practicability, advantages and disadvantages of extending the Town-Planning Acts, in particular the powers with regard to zoning, to built-up areas. Mr. W. Edgar Horne is acting as chairman of the committee, other members being Messrs. C. H. Bedells, W. R. Davidge, J. J. Done, E. W. Eason, F. M. Elgood, J. G. Head, F. Longstreth Thompson, Dendy Watney, and John Willmot.

WATER PIPES AND FITTINGS.

THE preparation of new by-laws by water undertakings recently aroused some discussion among the manufacturers of water fittings as to what would be required under the proposed new regulations, and in view of this position the Minister of Health appointed a committee to advise him on questions relating to (*a*) the construction and standardisation and testing of water pipes and fittings, and (*b*) by-laws or regulations for preventing the waste, undue consumption, misuse, or contamination of water. This committee has now issued its report, which takes the form of a specification showing what should be the minimum requirements as to water fittings commonly in use in order to prevent waste of water and undue expense for repairs and renewals. It is hoped that this specification will do much towards standardisation in the important parts of water fittings, but it is not thought advisable at present to endeavour to enforce strict standardisation. The Committee recommends that all water fittings be tested before use, but is not prepared to recommend that at the present time legislation should be introduced to make testing compulsory; the opinion is expressed, however, that it would be of great benefit if a sufficient number of testing stations were set up under the joint management of water undertakings and manufacturers, in which there would be a uniform standard of testing. Copies of the report, containing the specification, which deals with (*a*) supply, distributing, flushing and warming pipes; (*b*) cisterns; (*c*) water closet apparatus; (*d*) hot-water apparatus; (*e*) baths, lavatories and sinks, and (*f*) taps and valves, may be obtained from H.M. Stationery Office, price 3d. net. The next task of the committee is to consider what modifications should be made in the by-laws relating to water fittings now in use, and measures have been taken to this end.

TRADE NEWS

We have received from Messrs. J. H. Heathman, Ltd., Fulham, London, S.W., an illustrated catalogue dealing with their well-known ladders, trestles and steps. The fire-protection appliances cover almost every conceivable range, from a folding Eton ladder which can be closed in a box to wheeled ladders which can be extended to suit all ordinary purposes. A number of portable fire extinguishers are also illustrated. On the domestic side there is a variety of steps and ladders for all requirements.

The British Industries Fair, Birmingham, which will be held from February 16 to 27, 1925, includes in the Construction, Building and Decoration Group: Building materials, builders' ironmongery and hardware, architectural and ornamental work, constructional steelwork, ferro-concrete, sanitary apparatus, appliances and fittings, contractors' plant, shop, bar and restaurant fittings, paints, colours, enamels, varnishes, stains, polishes, lacquers, metal powders, glues and adhesives, mechanical and hand-painting and spraying apparatus, decorating materials, wall papers and coverings.

NEW INVENTION

AN ingenious new rule, called the "Interlox" master slide rule, has been put on the market by Messrs. Clark, Hunt & Co., Ltd., Middlesex Ironworks, E.1. The rule is of the extension type, which, when closed, measures only 8 in. by 2 in., and when fully extended is 5 ft. in length. Whether open or closed, the slides are securely locked with an interlocking device which operates automatically as the rule is extended. One side of the rule is marked off in inches and fractions of an inch in the ordinary way, and the reverse may be used as an inside caliper. It is claimed to be the only rule in the world which takes inside measurements rapidly and accurately and which reads direct, and has many uses for the architect in taking inside measurements in positions which are difficult to get at. It is light and can be easily carried in the pocket. Various sizes are made to meet different requirements.

Phillips: bungalow, Grove-road, Mr. E. A. Johns.—The B.S. has prepared the following schemes: Widening Elson-road, £3,300; lay-out of King's Bottom as a recreation ground, £3,000; lay-out of the esplanade adjoining the landing-stage £2,300; erection of public conveniences on the esplanade, £1,200.—The Board of Education has passed preliminary plans for the proposed central school.

HARROGATE.—The L.N.E.Rly. are carrying out extensive alterations at Harrogate Station.

HAVERFORDWEST.—The B.G. has called for estimates of the cost of concreting the grounds of the Children's Homes, and for erection of play shelters.—The Standing Joint Committee is to effect the repair of the Castle.

HAZEL GROVE.—The Building and Housing Committee passed plans: Bungalow, Bramhall Moor-lane, for Mr. F. A. Blackburn; six houses, Kitts Moss-lane, for Mr. G. Corrie; two houses, Offerton-road, for Mr. T. Shaw.

HORNSEY.—A new elementary school is to be erected at Coppett's-road. The land, comprising of about 8 acres, is to be purchased by the T.C. at a cost of £5,500, to which has to be added the cost of erecting a fence, £550.

HOVE.—The Works Committee of the T.C. recommend that a strip of land about one-third of an acre in extent be purchased for the extension of the buildings at the house refuse works. The price suggested is £300.

HOYLAND.—The U.D.C. has acquired 13 acres of land, at £200 per acre, in Cobcar-lane, Elsecar, for housing purposes. It was decided to arrange for the erection of 80 houses.

JARROW.—The T.C. has decided, in order to provide suitable school medical services accommodation, to entirely reconstruct an establishment at the juncture of Walter-street and Grange-road, at an estimated expenditure of £1,360.

LEEDS.—A site has been secured in Hall-lane, Armley, by the R.C. congregation for the erection of a new school for the Holy Family Church.

LITTLEBOROUGH.—Application is to be made by the D.C. for sanction to borrow £8,260 in connection with the erection of 16 houses on Calderbrook-road housing site.

LLANDUDNO.—The U.D.C. proposes further improvements at the Happy Valley, at a cost of £500. Instead of erecting a new golf house, it is now proposed to extend and alter the present building. Plans passed: New bank premises, Hestyn-avenue, for Lloyds Bank, Ltd.; 22 houses, Howard-road, for Messrs. Hughes, Savage, and others. The Surveyor is to prepare a scheme for the utilisation of the brickfield site for the erection of small working-class houses.

LONDON (BERMONDSEY).—The L.C.C. recommend the borrowing by the B.C. of an amount not exceeding £6,060 for housing purposes.

LONDON (DEPTFORD).—The L.C.C. recommend the borrowing by the B.C. of an amount not exceeding £701 for housing.

LONDON (GREENWICH).—The L.C.C. approve the borrowing by the B.C. of an amount not exceeding £2,400 for the construction of a retaining wall and embankment in connection with a depot.

LONDON (HACKNEY).—The recommendation has been received by the B.C. for borrowing £2,700 for housing purposes from the L.C.C.

LONDON (LAMBETH).—Houses, 69 and 71, Effra-road, for E. Evans & Sons; rebuilding of 170, Newington Butts, for Newington Electric Theatre, Ltd.; buildings, 126, Norwood-road, for G. Spencer & Co.

LONDON (WANDSWORTH).—The L.C.C. approve the borrowing by the B.C. of an amount not exceeding £925 for the acquisition of a site for housing purposes.

LONDON (WOOLWICH).—The B.C. recommend that the public urinal opposite "The Kent Arms," Albert-road, be re-erected in a new position as shown on the plan submitted by the Borough Engineer, at an estimated cost of £110.—The Borough Engineer has been asked to submit detailed plans for the erection of a branch library at New Eltham, with estimates to include fittings and furniture, in order that building operations can be proceeded with at the earliest moment, after the acquisition of the site; and further extension to the present building on the ground at the rear of the Plumstead Library, to provide a Juvenile Department.—The L.C.C. have approved the borrowing by the B.C. of £52,200 for housing purposes.

MANCHESTER.—The Watch Committee of the City Council has agreed to grant a loan of £2,000 to the Managers of the Holmes Chapel Training School for proposed improvements and extensions to their buildings. Improvements are to be made to the Female wash baths at the Osborne-street Baths, including the provision of six extra wash baths by alterations of a disused room, estimated to cost £1,750. At the Cheetham Town Hall repairs and alterations, £610, and new heating apparatus installation, £500, is to be carried out. Plans have been submitted for the erection of public elementary schools at Gorton Mount, Wilbraham-road and Claremont-road, and have been forwarded to the B.E. for approval.

MANSFIELD.—T.C. passed plans: W. A. Taylor bungalow, Robert-avenue; L. L. Bright, five houses, Mill-street; H. James, Junr., two houses, Bottle-lane; J. P. Smith, 12 houses, Warwick-drive; F. Bowskill, house, Intake-avenue; H. Ashley, house, Chesterfield-road; A. Farnsworth, four houses, Southwell-road. Rainworth; J. J. Anderson, house, Lichfield-lane; Thos. Simpson, bungalow, Frank-avenue; G. Pritchard,

bungalow, Intake-avenue; F. Boole, house, Intake-avenue; J. W. Kitchen, house, Frank-avenue; R. Hall, house, Frank-avenue; Jenny Darby, bungalow, Sutton-road; Intake Freehold Land Society, new streets and sewers on Intake Freehold Estate, Sutton-road.

METHLEY.—The West Riding C.C. are authorised to expend a sum of £932 15s. 6d. in carrying out repairs to Methley Bridge.

MILTON.—The R.D.C. passed plans: Two bungalows, Marshall-road, Rainham; two bungalows, Borden-lane.

NEWPORT (MON).—The Council propose spending between £100,000 and £200,000 in remodelling the town market.

NORTHFLEET.—Plans passed by U.D.C.: Ten houses, Park-avenue, for Messrs. Thomas, Ltd.

OTLEY.—The Commissioners of H.M.O.W. propose to erect a new telephone exchange and post office at Otley. Plans and specifications have been prepared by the Architect's Department, King Charles-street, London, and tenders are shortly to be invited.

PONTEFRACT.—Plans passed: Shop at Fryston-road, Airedale, for Mr. F. Harper; and outbuildings and garages at hotel in Fryston-road, Airedale, for Messrs. John Smith & Sons, Ltd., Tadcaster Brewery.

PURLEY. Plans passed by U.D.C.: Four houses, Roke Lodge-road, and two in Silverdale-road, for Mr. J. Oldaker; two bungalows, Brighton-road, for Mr. R. Berry; two houses, Northwood-avenue, for Messrs. Cleaver & Co., Ltd.; two houses, Bencombe-road, for Messrs. Roe & Son; house, Silver-lane, for Mr. S. Dussek; house, Woodcote-avenue, for Messrs. Morgan, Baines & Clark; four houses, Woodcote Valley-road, for Mr. D. Taylor; house, Northwood-avenue, for Mr. T. Parker; house, Downlands-road, for Mr. J. G. Cooper; extension to sub-station, for County of London Electricity Co.; house, Purley Bury-avenue, for Mr. H. Thomas; two new streets on Selsden Estate, for Percy Harvey Estates, Ltd.; two houses, Downland-road, for Mr. G. Cooper.

PUTNEY.—The B.C. has asked a sub-committee to report as to the provision of an open-air swimming-bath. Plans passed: Three houses, Dover Estate, for Messrs. William Willett, Ltd.; house, Crestway, for Messrs. Willett, Ltd.; petrol station, Kingston-road, for Mr. F. Salmon.

RADCLIFFE.—Details of the proposed new bridge over the river Irwell have been submitted to the D.C. by the County Borough of Bury, and are now under consideration.

SELKIRK.—The T.C. has accepted tenders in connection with the erection of five blocks of four three-apartment houses under the Burgh housing scheme. The tenders amount to £9,964 9s. 10d.

SHELF.—The D.C. passed plans for three houses for Mr. A. Walker at the Garden City.

SKEGNESS.—The T.C. has approved a scheme, estimated to cost £25,000, comprising the development of the central portion of the Marine Gardens, together with the construction of a new bandstand. A huge open-air bathing pool, with large café and terraces, is also to be constructed as part of the scheme. Another scheme which is about to be commenced is the erection of a boathouse shelter with accommodation for 1,500 persons, and the reconstruction of a large section of the North Parade, at an estimated cost of £5,000.

SMETHWICK.—The T.C. recommend that applications be made to the M.H. for sanction to borrow £5,000 to cover advances towards the erection of houses.—Plans passed by the T.C.: 7 houses, Devonshire-road, for Mr. G. Sorrill; 2 houses, Holly-lane, for Messrs. Strong Bros.; house, Beakes-road, for Mr. F. E. Minton.

STAINFORTH.—Plans have been prepared for a new Wesleyan church, at an estimated cost of about £9,000. Tenders are about to be invited.

STAMFORD.—A new police station is to be erected, together with quarters for the inspector of the station, at a cost estimated between £12,000 to £15,000.

STANDISH.—The U.D.C. approved plans: Two bungalows, Arbour-lane, for Mr. Harry Baxter.

STOCKTON.—The R.D.C. has approved a plan for the erection of a detached bungalow at Urlay Nook-road, Eaglescliffe, for Mr. E. Bell.

SUNDERLAND.—The T.C. approved the old Barclay-street district police station being taken over by the E.C. for use as a domestic science centre for pupils attending schools on the north side of the river, and it will be fitted up for use as a cookery, laundry, and housewifery establishment, at an estimated cost of £195.—Plans approved: Mr. M. McGlynn, 48 houses adjoining Reginald-street.

TADCASTER.—Plans passed by R.D.C.: Bungalow in Newthorpe-road, Barwick, for Mr. A. Higgins; layout of a new street at the rear of Carlton-road, Allerton-Bywater, for Mr. J. W. Booker; two houses in Milton-drive, Scholes, for Messrs. Fryer & Fairburn.

TEWKESBURY.—A scheme is to be prepared for housing on the Priors Estate.

TORQUAY.—The T.C. passed plans: House, Torbay Hall Estate, for Mrs. Williams; bungalow, Blindwylle-road, Sherwell Valley, for Mr. Crispin; bungalow, Warberry Vale Estate, for Mrs. E. Taylor; four houses, Sherwell-lane, for Messrs. Chelston Building and Decorating Co.; bungalow, Warberry Vale Estate, for Mrs. L. E. Foster; two houses, Coombe-lane, St. Marychurch, for Messrs. Torquay Building Company; bungalow, Hatfield-road, for Miss Hart; villa, Lydwell-road, for Miss D. Bonyon; new parish hall, St. Marychurch, for St. Marychurch Church Council; bungalow, Wellswood Hall Estate, for Mr. G. L. Windsor; house, Haytor-road, for Messrs. Turner & Bowden; pair of villas, Kent's-road, for Mr. J. F. Bennett; bungalow, plot No. 15, Blindwylle-road, Sherwell Valley, for Mr. H. Blackburn; four houses, Hampton Estate, St. Marychurch, for Mr. L. G. Wiltshire; house, Lydwell-road, for Mr. F. B. O. Hawes; pair of houses, Blindwylle-road, Sherwell Valley, for Messrs. Hooper & Roberts; bungalow, Steps-lane, Watcombe, for Mr. W. H. Kerslake; house, Wheatridge-lane, for Mr. F. R. Ball; 36 houses, Barton, for Messrs. Ball & Wilkinson; house, Sherwell-lane, for Mr. Hampson; house, Barton, for Mr. W. Hole; two houses, Black's Hill, for Messrs. Tolcher & Thurnell; Mr. H. C. Goss, 10 houses, Warberry Vale Estate.

TOW LAW.—The R.D.C. has passed plans for the erection of a new slaughter-house in High-street.

TRURO.—The B.S. has prepared plans for the erection of 89 houses on the Hendra site.

WAKEFIELD.—The architect is to discuss with the M.H. plans for the erection of 12 houses. The erection of a bandstand in the park is proposed. The Yorkshire (West Riding) Tramways Co. proposes the erection of houses for employees. Plans submitted by Messrs. Bell & Kay for the development of land between Thornes-road and Horbury-road have been approved. Plans passed: Warehouse, Denby-road, for Messrs. Newbald & Hartley; two houses, Thornes-road, for Messrs. J. W. Easter and B. Buckland; bungalow, Woodthorpe-lane, for Mr. H. C. Summers; house, Chevet-lane, for Messrs. A. Francis and J. Holdsworth; three houses, Oakleigh-avenue, for Mr. J. Caton; two houses, Thornes-road, for Mr. A. E. Lockwood; house, Thornes-road, for Mr. A. Gawthorpe; Welfare canteen and house, Denby Dale-road, for Patons & Baldwins, Ltd.—West Riding C.C. proposes to erect a building at the corner of Wood-street and Bond-terrace for the medical officer's staff, at a cost of £23,500, and buildings for the stores department at the depot, at a cost of £30,000.—Plans passed by R.D.C.: shop at Sharlston Common, for Mr. R. Wallace; two houses at Denby Dale-road, Crigglestone, for Mr. J. Dilks; sixteen houses at Upper Netherton, for the R.D.C.

WARRENPOINT.—The U.D.C. has decided to apply for a loan of £3,800 for the erection of 10 working-class houses.

WATFORD.—Funds are being raised for the repair to the old free schools.

WEST BRIDGFORD.—Plans passed by U.D.C.: Eight houses, Violet-road, Mr. Pepper; two houses, Pierrepont-road, Mr. C. Rogers; three houses, Dovedale-road, Mr. A. Goodchild; house, Melton-road, Mr. E. Tomlinson; two shops, Melton-road, Mr. H. Smith; house, Blake-road, Mr. R. D. C. Tanner; house, Rutland-road, Mr. Hopewell; four houses, Loughborough-road, Mr. Simons.

WESTON-SUPER-MARE.—The T.C. propose erecting a marine lake by converting Glentworth Bay; the scheme is estimated at £28,000; this also covers for a retaining wall. The lake will consist of 7 acres.

WEYMOUTH.—The B.S. has been asked to prepare plans for the construction of a jetty on the Weymouth side of the harbour.—Plans passed: House, Belle Vue-road, for Messrs. S. Board & Son; house, Little George-street, for Mr. J. H. Fields; bungalow, Bent Path-avenue, for Messrs. Jenkins, Ltd.; house, Alexandra-road, for Messrs. S. Jackson & Son; two houses, Southland-road, for Mr. Openshaw; house, Alexandra-road, for Mr. F. Greenaway; house, Claremont-road, for Messrs. Jesty & Baker.—The T.C. has decided to build 42 houses on the Westham site.—Conveniences on the Esplanade are to be carried out, at a cost of £2,250.—A waterway is to be constructed, at a cost of £978, from the River Wey to Radipole lake.

WILTHORPE.—Notice is given by the Barnsley E.C. of intention to erect an elementary school for about 500 children.

WOLVERHAMPTON.—The E.C. approved a proposal to extend the Municipal Secondary School at a cost of about £10,000 by the provision of a laboratory, a gymnasium, and extra classrooms. By these extensions the accommodation will be increased from 385 to 500.

WORCESTERSHIRE.—The Highways Committee of the C.C. proposes the construction of a ferro-concrete bridge and viaduct across the river Avon at Evesham, at a cost of £40,000.—Application to the Ministry to sanction loans of £14,328 for the further 36 houses, and £24,676 for the 62 houses, is being sought by the T.C.

FIRE.

BARRHEAD.—A fire broke out at the works of Messrs. Cochrane, Ltd., boilermakers. The damage is estimated at £50,000.

The Post Office Buff Book.

The October issue of the "Buff Book," the Trade and Commercial Directory for London, is now ready. It contains a list of practically all the principal firms engaged in trade and commerce in London, and classified under their trade heading, giving the telephone number and postal address. Publishers: Business Telephone Directories, Ltd., 25, Lawrence-lane, E.C.2.

Portsmouth War Memorial.

The Portsmouth naval war memorial was unveiled recently at Southsea by the Duke of York. It was the last to be unveiled of the three set up by the Imperial War Graves Commission to commemorate the naval ranks who fell in the War. Sir Robert Lorimer was the architect for the memorial, and Mr. Henry Poole, A.R.A., the sculptor. The memorial takes the form of a stone obelisk, crowned by a globe of copper, which is supported by four winged figures representing the wind.

PAYMENT BY R

This is a highly technical trea
been written, as the author state
to indicate those steps which
to correct the weaknesses by wh
can be affected, and to avoid
pitfalls which seem to beset th
of payment by results."

In these days of high wages a
tion the "man in the street" is
that the obvious remedy for all d
be the system of payment by r
passes on feeling that he has solve
problem, but a very cursory
volume will show him that alth
great merits in this system it can
beneficially without considerab
organisation and on a scientific b

The author further states t
history of payment by results
fluencing output in an upward
undoubtedly good, yet its effect
by the attitude of the trade societ
able, and the problem is to disco
which will effect an immediate a
improvement. In this connection
satisfactory to note that the auth
with great experience, especially
with the engineering trades, does
the failure experienced to lack
but to an economic cause, the la
"production knowledge," and th
suitable "production control," w
be acquired by management. H
cient output is not, never was, a
be, a matter of workmen's energie
should payment by results pla
sibility for low output entirely upo
but the object to be attained
efficiency in the broadest possible
extracts from the preface appear t
note to the whole work which, in
sets out the preliminary investi
should be made and how the nec
ductive knowledge" should be o
how the system should be put in

This is a work that requires clo
the writer does not attempt t
summaries of the conclusion to b
and the subject matter of the
appear to make this impossible, b
a practical treatise founded upon
ence and illustrated with example
actual practice. Some idea of the
work can be obtained from the he
chapters, as: "Some examples o
and high cost"; "The applicabilit
by results"; "Job rates and the
output"; "The basis of job rat
vidual or collective systems." I
that if a system of payment by re
put in force the question at w
remuneration is to be fixed is o
importance, being, in fact, the bas
system, and, being the basis, sta
rate, when once fixed, is of the gr
ance. If the rate is fixed on an
basis the rate paid may have to
cutting of rates prejudices the wh

The author shows both the desi
system and the numerous factor
to be taken into consideration in
operation, the conditions in whic
for application, and the causes w
failure; the whole subject being
examples founded on practice.

It appears to us that the preju
existed against systems of paym
on the part of trade unions and ot
resulted from the attempts to
system on a wrong basis without
knowledge.

Report of Labour Comm

In our comments on the Repor
Commission on Production in
p. 615, the end of the second
tained the words: "The interp
reads." This phrase has no c
the argument, and should have b

* "Payment by Results." By

NEW BUILDINGS IN SCOTLAND

Edinburgh.—VARIOUS.—Plans granted: Bungalow at Milton-road, Joppa, for John Banks and others (architects, Messrs. Lyle & Constable, 3, Hill-street); house, Braid Hills-road, Liberton, for Alex. Mackenzie (architect, Mr. W. B. Wylie, 10, St. Andrew's-square); bungalow, Barnton East-avenue, Davidson's Mains, for Alex. Chisholm (architect, Mr. E. E. Pearson, 27, Rutland-street); bungalow, Barnton-avenue East, Davidson's Mains, for Jas. H. Moodie (architect, Mr. E. E. Pearson). The following plans are continued: Halls, &c., Duke-street, Leith, for Evangelical Union Congregational Church; cottage, Parkhead, Juniper Green, for John Stewart.

Motherwell.—COTTAGES.—Plans passed by the Dean of Guild Court: Cottage, Hamilton-road, for Archibald Ferguson; cottage, Jerviston-road, for G. Johnstone.

Port Glasgow.—ALTERATIONS.—The T.C. and the Burkmyre Bowling Club have arranged for the renovation and extension of the bowl-house at the Public Park. It is proposed to spend £800 on the alterations, &c.

Jersey Housing.

Sir Jesse Boot recently undertook to spend a sum of not less than £40,000 for the erection of artisan dwellings at St. Helier.

New Premises, Liverpool.

Mr. J. R. Sharman, of 6, Queen Anne's Gate, S.W.1, has been appointed as consulting engineer in connection with the new building in Water-street, Liverpool, to be erected for Messrs. Alfred Holt & Co., at an estimated cost of £900,000. Demolition of the old buildings on half of the site is now completed by Messrs. Wm. Moss & Son, Ltd., of Roscoe-street, Liverpool, and a contract for the excavations and foundations will be shortly placed. Tenders for steelwork will probably be sought in about two months' time.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Plas-terers' Masons' Labourers.

Obituary.

ccurred recently, in his 77th year, High West Jesmond, Newcastle, nder Pringle, builder and con- neside.

ook place recently, at Burton-on- Albert Edward Thorpe, builder , at the age of 44 years.

r Women's Housing Council.

of the Westminster Women's cil was held recently at 5, St. when Miss Picton-Turberville, ke of the bad state of the h a great number of the people were forced to live, owing to f houses. It was uneconomic he said, and no one ought to be nder such conditions, but the o could do anything were the resolution which desired to the Westminster City Council of improved housing conditions, hat in the selection of the new of Health special consideration to his qualifications and experi- with housing problems, was usly.

SANITATION*

This well-known book has been re-written by Mr. John H. Clarke, the senior sanitary inspector of Chiswick. It is intended not only as a text-book for examination candidates, but also as a handbook for sanitary inspectors in office. Their duties are so multifarious that few can do without occasional reference to a reliable handbook. Time was when the sanitary inspector referred everything he was doubtful about to the M.O.H.; now he is expected to be able to carry out all his duties without specific and special instructions. The book opens with some useful hints to students, and then starts upon the general subject. The first chapter gives an account of the acts and regulations under which sanitary inspectors are appointed, the qualifications for an inspector, and the regulations and syllabuses of the various sanitary examining bodies. The next chapter explains when and how general inspections should be made, and complete forms of notices, and a very useful description of the standards of fitness in the inspection of dwelling houses. Chapter III deals with housing and town planning so far as the sanitary inspector is concerned, cellar dwellings and lodging houses, and the definition of terms used in the Public Health Acts. Chapter IV on "Nuisances," is one of the most important. It describes in detail all the various statutory nuisances, how to proceed to procure their abatement, the various points to note in the general inspection of a district for the purpose of detecting nuisances, notices and forms of report. A short chapter on scavenging and cleaning follows, and we then come to the important subject of the disposal of excreta. After describing Moule's earth closet and the modern form of rural privy, the author deals with country house sewage purification, but so briefly that it might as well have been omitted; fortunately it does not come within the province of an inspector to devise such an installation, and very rarely has he anything at all to do with one. Chapter VII upon the subject of house drainage is particularly within the purview of the inspector, but the method of regulating the gradients is not described; in the table of stoneware pipes the column giving weight per foot would have been more useful if it gave instead the weight per pipe, including the socket; Dr. Angus Smith's preparation for iron pipes is wrongly described as tar heated to a temperature of 400 deg. F.; cast-iron pipes are recommended to be jointed with spun yarn or hemp and molten lead, whereas lead wool is infinitely superior. Some drainage by-laws are given, and then we have a chapter on water closets, following the usual lines and fairly well illustrated, although we miss the section of the ordinary wash-out and wash-down pedestals. Gullies and traps are taken next, followed by a rather general description of the examination of drains. Possibly the author expects the would-be inspector to get the whole of his practical training by actually assisting in the work, to which, of course, no objection can be raised. A useful feature of the book is that in every case in which the sanitary inspector is called upon to serve, the actual words of the Act or regulation or by-law are given in full. Infectious diseases and disinfection naturally receive rather full description, as a large portion of the inspectors' duties are there concerned. Inspection of meat and animals, dairies, cow-sheds, fish inspection, sampling under Food and Drugs Act come next. Then the rather complex matters relating to factories and workshops, canal boats, common lodging houses and Shop Acts, concluding with a reprint of the model by-laws of the L.G.B. under the P.H.(L.)A., 1891.

The book is admirably arranged, and gives a large amount of information especially upon what might be called the "red-tape" part of the work. This expression is not meant offensively, but those who are acquainted with the duties of an inspector know that he is surrounded by rules and regulations which he must be very careful to follow strictly, otherwise trouble may supervene. It would be impossible for anyone intending to become an inspector to find a better book than this to help him on his way; with six months' close study of this and three months of going the rounds with an inspector in office, he should be fully equipped for a certificate of fitness.

* "Taylor's Sanitary Inspectors' Handbook." A manual for Sanitary Inspectors, Inspectors of Meat and other Foods. Sixth edition, edited and re-written by John H. Clarke. With 116 illustrations. Cr. 8vo. 540 pp. (London: H. K. Lewis & Co., Ltd.) 1924. 12s. 6d. net.

New Buildings near London.

The Ministry of Health has given its approval to the proposal of the Hendon Board of Guardians to build a large new institution and hospital near Edgware, Middlesex. A large site at Redhill has been acquired and laid out for the reception of buildings to accommodate, when complete, 500 beds. The work will be carried out gradually, and the first section will include five wards, holding 175 beds, nurses' and matron's quarters, laundry, central heating block, &c. The plans have been prepared by Messrs. Paine & Hobday, of 45, Bedford-row, W.C.1; the quantity surveyors are Messrs. John Leaning & Sons, 28, John-street, Bedford-row, W.C.1, and the civil engineers are Messrs. Dolby & Williamson, of 8, Princes-street, S.W.1.

A new factory building is to be erected on a site in Victoria-road, Acton, for carrying on a light engineering trade. Covering an area of about 6,250 ft., the premises will be of four stories, and will be erected on a steel frame with brick filling and reinforced concrete floors. The roof will be flat, of concrete covered with asphalte. In order to give light, as much wall space as possible is being eliminated and large steel casement windows are to be inserted. Heating by a low-pressure hot water system is being adopted. The architect is Mr. R. F. Bargman, F.R.I.B.A., of South-street, Dorking.

The large property at the foot of Richmond Bridge, Surrey, known as the Tower House, and comprising six floors, with extensive mews, has been acquired by Messrs. Sam Isaacs, Ltd. The ground and first floors are to be converted into a large up-to-date restaurant, whilst the upper stories will be divided into self-contained flats, with separate entrances, &c. The architects are Messrs. North, Robin & Wilsdon, of 35–39, Maddox-street, London, W.1.

No. 4265. OCTOBER 31, 1924.

THE NEW SESSION

not without significance that the opening of the new sion and with it the commencement of a new era in hitectural affairs, which makes the R.I.B.A. the focal nt of interest and endeavour, corresponds with dawn of a new hope in the affairs of Western a move forward from the negative position to a lute attempt to settle the questions of reparations, re the maintenance of peace and goodwill between nd, we hope, the advent of a stable government at it that, at last, architecture is in closer touch with al life? And, if so, may we not hope that this awaken- esult in much good, not only to the profession itself, o the nation as a whole?

ient times it was customary, on such occasions, for s to be consulted, both in order that the past and rents should be correctly interpreted as a guide to licy, and also that some inspired forecast or vision ure could be obtained. We do not know, at the f writing, whether the address to be delivered by the at the inaugural meeting of the R.I.B.A. session in any detailed exposition of policy, or whether it the tradition of recent years; but the present moment portune for such a survey in order that the s for the future may be studied and an indication ay be attempted and perhaps—given the new unity hitectural profession—achieved by wise direction and counsels.

ear has been noteworthy for more than one event have a permanent influence on the future of the in our Empire. First in importance is the cessation dissensions or party politics within the Institute he adoption of an agreed scheme for the unification fession, with the possibility of statutory registration future. In itself, we do not attach that measure of to registration (as an unfailing panacea for most of the architectural practitioner) which seems to be d. But there can be no doubt that the spirit of and co-operation which is now (it may reasonably the driving force behind the Institute, as the repre- of a united profession, opens an entirely new era, which the results to be obtained by a courageous ssive policy will justify the sacrifices made in the nity. That such a spirit exists was shown at the nnual conference at Oxford; it only remains to see will be used with foresight and courage, or allowed te in sterile discussions.

event of the past session, the importance of which ciently appreciated, was the International Congress tural Education. This will, we believe, have a con- fect on the important question of the training of the ot only in the schools of our own Empire but in her countries. We understand that, on the advice ch delegates and with the approval of the Minister nstruction and Fine Arts, a full translation of the of the congress will shortly be published in Paris, at centre will no doubt find its way to most of the Europe. And among the more recent happenings be noticed in connection with the work of the Insti- associated societies, we note that the Franco-British rchitects has appointed a special joint committee and British architects to investigate the whole estion of the regulation of international compe-

dications of the way in which the Institute and the ies are working for the good of the profession are show it does not neglect its opportunities. But more could be done? We would like to see the the Empire, as represented by the Institute, taking place in those questions of the national life which are too often settled without any reference to the one body competent to give advice and to direct policy in such matters.

We should like, for instance, to see the Institute initiate (in agreement with the employers and operatives in the building trades) a non-party scheme for the solution of the urgent and menacing problem of national housing. There is little doubt that practically all the present labour disputes and troubles can be traced back to the legitimate dissatisfaction of the majority of the population with the conditions of existence as contrasted with those of the more fortunate minority. This dissatisfaction has, no doubt, been intensified rather than diminished by the co-operation of the architects themselves in housing schemes, whereby an enormous "uplift" to the public taste has been given. The nation will no longer tolerate the miserable dwellings of nineteenth-century industrial centres, but demands houses which have character, light, air and convenience. Is it not therefore evident that there is a reasonably greater chance of success for a national housing scheme worked out by men who are experts, rather than those made by politicians, who must necessarily be influenced by party or other interests?

We should like to see, as we have recently suggested, some endeavour made to restore stable conditions in the building trade, and we believe that an impartial investigation of the causes of dispute would result in the creation of a board of arbitration, acceptable to all parties, to which any matters in dispute might be referred, without recourse to strikes and constant dislocation in the industry.

And we should like to see a closer co-operation between architects, engineers, painters, sculptors and builders, with a broader programme for the R.I.B.A. sessional meetings, with papers from distinguished representatives of the allied arts and professions—joint meetings where subjects of interest to the various arts or professions could be debated on equal terms—and have no doubt that this would result in an increase of public interest and establish a mutual appreciation and respect between the various arts, professions and trades concerned. It would also have the great advantage of demonstrating to the average citizen the intimate connection of architecture with the ordinary life of a civilised community.

We should like to see, in the best interests of the profession and of the Institute itself, some more intelligent use of publicity and the creation of a special committee composed of representatives of the Council, the standing committees, and the various journals of the technical press. It is unnecessary to describe in detail the manifest advantages of such a scheme in organising propaganda work on matters of public interest, such, for example, as the Charing Cross Bridge scheme, as we believe the advantages of such co-operation are sufficiently obvious.

And finally, we should like to see a larger proportion of the younger generation of architects taking part in the work of the Institute. We are, of course, aware of the difficulties which exist, of which the chief is that a young architect who has given proof of ability, and is, in consequence, nominated for election to the Council, may not be sufficiently well known to the general body of members to secure the requisite number of votes for election. We would suggest that this might be overcome, in part, at any rate, if a certain proportion of the vacancies on the standing committees were reserved for special nominees of the Council or the schools; in this way the younger men would be able to acquire some experience of Institute affairs before, in due course, being called upon to share the responsibility of representing their fellow-members on the R.I.B.A. Council.

There are other matters, some of which may be of minor importance and others not expedient; but we have endeavoured to show what might be attempted and even achieved under the new conditions, given courage, initiative, and self-sacrificing devotion on behalf of the great cause of architecture as the first and last of the arts of civilisation.

NOTES.

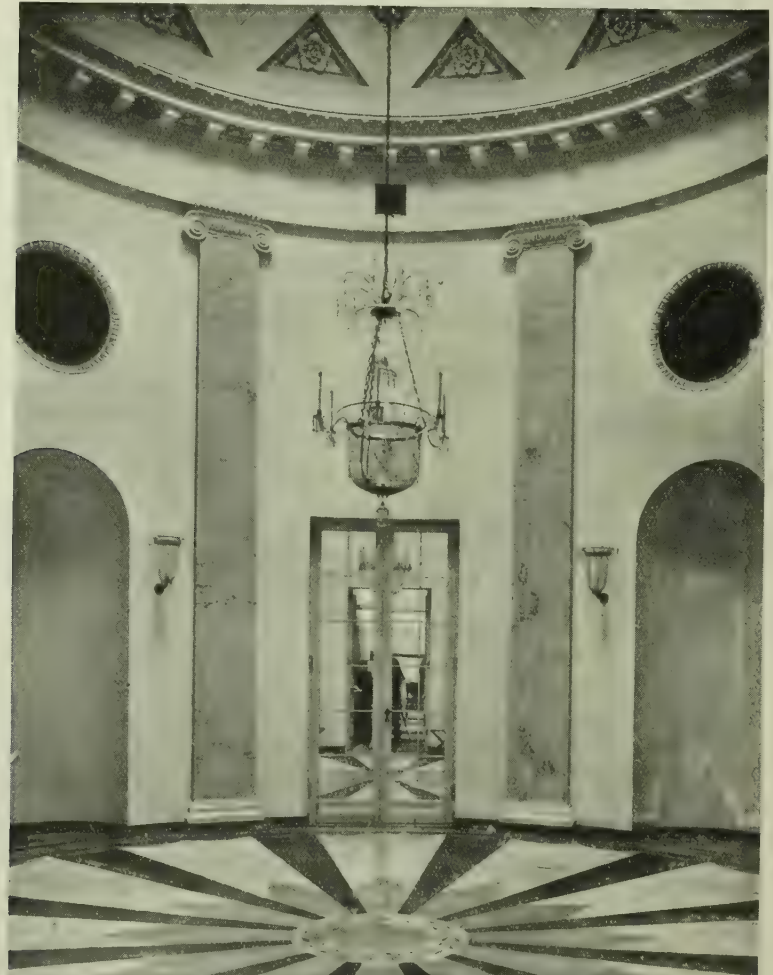
Unemployment and the Building Trade.

THE true state of affairs as regards unemployment was pertinently shown in a letter by Mr. Baillie Scott to which we referred last week. A large amount of unemployment could be set right by the employment of unskilled men in the building trade. The position is both serious and ludicrous, and is dealt with in a letter to the *Times* by Mr. Arthur Keen which pointedly suggests that the trade unions are not free of responsibility. The protection of trades in all their just rights is a laudable enough object, but is this a time to be standing on the letter of the law when some measure of relief from the serious evil of unemployment could be remedied by a loosening of the restrictions which appear to hamper members of the unions? Some little time since we asked a builder how he was getting on, and he said he was in no trouble, for hardly any of his men were members of the trade union. Mr. Keen says it is his belief that before long the best of the men will throw over their unions and apply themselves to getting all the money they can earn by their utmost individual effort. There are times when it is advisable to take a broad view of life and sacrifice individual or class benefits for the general good. Is not this such a time? What a pity it is that all of us do not try to take the broader view and realise more clearly the importance of the general good. We do not take sides in politics, but we do think that in the heat of party arguments there is not enough credit allowed for the general and urgent desire to maintain and improve the conditions of the poorer classes. The first main instinct of humanity may be purely selfish, but we know little of the true philosophy of life until we learn that even our own well-being is largely bound up with the well-being of others. At the present moment there are numerous possibilities awaiting the building trade. Given fair conditions for all and a confidence in the spirit of fair dealing, these possibilities would quickly turn into realities, and the building trade would enter on an unexampled period of activity and prosperity. What is it that bars the way? Nothing whatever but the lack of confidence in each other's sense of fairness and goodwill.

The A.A.

THE President, Mr. H. S. Goodhart-Rendel, selecting "Yesterday and To-morrow" as the title of his inaugural paper at the Architectural Association, indulged in some straight —a form of medicine badly need architecture of to-day. We abstract of his address on p. 67 course of which he said that the ture of Regent-street, far from architecture of to-morrow, is representative of to-day, but generically to yesterday. In sp the public, he asserted that the cares nothing about the appeara building is a godsend to the ar comparison with the man who kn he wants and whose views are opposed to the present-day arc trend of thought; he probably ins "Period" rooms and even upon houses, thus seriously hindering lopment of a real modern arc We can only obtain that when has been trained to want the ri

Concrete Churches.



THE subsequent d centred principally possibilities of concrete as a ma church building in suitable Mr. H. M. Fletcher's descripti Paris church built with "birdcag stimulated the imagination, au readily be believed that reinfo crete is capable of achieving be freedom of line and lends itself forms of illumination. The diff this country is to get the opport experiment in such a material for tical purposes. The President when he said that the innate cons of the British public will amply prevent us from making "as ourselves in the experimental although we are, of course, perfe to do so on established lines.

The A.A. Sketches.

THE exhibition o tectural Associatio sketches always high level, but this general average is of conspicuo While architecture naturally large s are of space, yet the sub selected with commendable Most of the sketches are the wo Architectural Association st students, or of those intimately with the school; they reveal kinship which, while allowin opportunity for individuality, freakishly modern nor conventio exhibition includes some remarka ings and photographs and is w a visit.

By G. Yakuloff.

ce lies in the fact that for the in England the sister arts of erature, painting, sculpture, and, the mistress art of architecture, sembled in one home for common inspiration. Many, doubtless, n speculated upon the possibility n ideal institution, but it is now become a reality, and it is that by May next the scheme fficiently advanced to enable an exhibition to be held. It is at the old Chenil Galleries, the oint in the career of many rtists, and the adjoining pre- e original home of the Chelsea , should have been chosen as the new and greater home for the e intentions of the promoters ehensive. There are to be large galleries for paintings, drawings, l sculpture, a musical society, club, a school of arts, a large private studios, a first-class , a café, a library and a hall for chamber-music, dancing and ial gatherings. The architects s. Kennedy & Nightingale.

---

ide We know how often our churches suffer through donors who with the best t. intentions present to them gifts of very defective artis- he same time, there is natural n refusing them, though in the st of the church it is necessary We think the same difficulty is d by the Trustees of our Collections, and the letter of hrey Ward, in *The Times*, in o the refusal by the Trustees of nal Galleries of the pictures nation by the late Sir Claude a case in point. The writer uggestion which might well be nind by donors contemplating o the nation, pointing out how r it would be to leave a power o the Trustees. The National Gallery is already crowded with many more pictures than it can show, and it is only where examples are of an almost unique value that they should be accepted for the nation. In the case of the recent Mond bequest there were those who felt that the nation was saddled with a good many pictures which, though of respectable origin and character, were of no such outstanding merit as would justify adding all of them to a collection so well represented by pictures of similar character. It would be a pity if the "old master" were to become a burden rather than a delight.

The Wertheimer Bequest.

This is an equal or greater danger in the case of bequests of modern work, and, as so well stated by Mr. Humphrey Ward, "How much more grateful we should be to the memory of the late Asher Wertheimer if he had left it to the Trustees to select the three best of his Sargents, instead of forcing his whole family upon the country." If we are to keep up the character of our national collections a greater restraint will have to be imposed. The Tate Gallery suffers from the presence of some very poor artistry in the collection, through its too ready yielding to popular reputation, which has led to the inclusion of examples which a little later it will appear absurd to have ever included. No doubt it is difficult for the Trustees to preserve that detachment from popular influences which is so important in such a charge, and which to us appears to make it desirable that no modern work should be accepted for a national collection for a period of ten years from the date of its production.

The Indian Art Renaissance.

The proposal of Sir G. Lloyd, of the Indian Society, for permanent representation in our art galleries of modern Indian art is not without interest, but the contribution made through present-day developments of art training in India may be open to more question. When we are told of "Indian Art Renaissance," we are inclined to inquire more particularly what this means. We are far from saying there is no advance, and are inclined to regard favourably present-day developments of art training in India which have the support of so thoughtful an administrator as Lord Ronaldshay. The question cannot, however, be regarded in the abstract, but on what use we are going to make of this advance in training, in what way will it be applied? If the training of the Bombay School of Art is to be of value it will be alive to the dangers of its absorption into the industrialism of the West. Is there no danger of recreating Indian art on Occidental methods which replaces the native craftsman and the workshop by the "studio" artist on one side, and the operative on the other? Is Indian art even needing any such renaissance? Is not native traditional work so much better? We cannot develop here all the considerations so manifold and far-reaching which challenge the complacency of those who regard the art training in vogue as the best means of fostering beauty. But the kind of results achieved suggest to us that the whole subject is in need of reconsideration.

GENERAL NEWS

Professional Announcement.

Mr. Harold Lansdown, F.S.I., having relinquished his position as Quantity Surveyor to the Ministry of Health (Housing), has resumed private practice at 9, Regent-street, S.W., and Hampton Wick.

The Painters' Company.

Mr. Octavius Satchell has been elected Master of the Painters' Company.

Architect's Estate.

Mr. William John Middleton, of Belsize-road, South Hampstead, N.W., £12,318.

Royal College of Art.

Mr. Ernest Cole has been appointed Professor of Sculpture at the Royal College of Art, in succession to Mr. F. Derwent Wood, R.A.

Obituary.

The death took place recently of Mr. John Robert Hall, a well-known Sheffield architect. Mr. Hall, who was 60 years of age, was the son of the late Mr. James Hall, who was also an architect, and who erected among other prominent buildings, the Firvale Workhouse. He was articled to his father, and, on the death of the latter, was joined in partnership by Alderman W. C. Fenton. Mr. Hall was a member of the Sheffield Society of Architects, and on the council of that body.

The death occurred recently, at South Shields, of Mr. Frederic Dalzeil Hayton, who had for many years been a member of the firm of Messrs. J. H. Morton & Son, architects, of that town.

New Thames Bridge.

The Albert Bridge over the Thames, near Datchet, is to be demolished and a new bridge built in its place. The work will be begun in the course of the next few days. The new bridge will be made of reinforced concrete, and is the third bridge of this material to be built over the Thames. It will be in the Renaissance style, but with squared rubble towers, to obviate conflict with the Norman architectural surroundings. The design has been prepared by the County Surveyors of Berkshire and Buckinghamshire, Lieut.-Colonel J. F. Hawkins and Mr. E. Winfield, respectively. The bridge will consist of two unequal span arches, that on the Berks side 75 ft., and that on the Bucks side 110 ft., with a centre outwater pier 15 ft. wide, and is designed to carry all classes of modern traffic. The bridge will be built on the system of the Trussed Concrete Steel Co., Ltd., 22, Cranley-gardens, South Kensington, S.W.7, by Messrs. A. Jackaman & Sons, of Slough, Bucks.

County Architectural Training.

At a recent meeting of the West Riding Education Committee the appointment of three pupils under the West Riding Education Architect was discussed. Sir James P. Hinchliffe (Chairman of the West Riding County Council), in the course of his remarks said it was an important departure, and, he thought, a wise one, in that it gave youths in the county an opportunity of serving an apprenticeship to a profession which was really specialised, because local government architecture as regards schools was a specialised business. The pupils would enter into a five years' apprenticeship, without payment of premium, and at a salary of 10s. a week during the period of apprenticeship. The practice of heads of departments of the County Council having articled pupils was discontinued about twenty years ago, but it seemed a pity that a large authority like the County Council did not take its share of responsibility in training reliable officials. He hoped that would be only the beginning of a wider movement in the departments of the County Council to give encouragement as far as possible to the youth of the county in architectural education.

CORRESPONDENCE

On the Choice of a Limestone and its Preservation.

SIR,—Architects and builders are much puzzled to know which of the various limestones on the market to choose, especially when it has to be used in a modern city and subjected to the attack of sulphur acids in the air. I have been making experiments on this with a view to classifying limestones and have come to the following conclusions :—

In the first place, the limestone should be subjected to a test to determine the rate at which it yields to acid attack. Limestones vary widely in their susceptibility, some resisting remarkably while others quickly crumble.

In the next place, its porosity and rate of evaporation and absorption should be measured. The destruction of the limestone is principally due to the formation within the pores of crystals of sulphate of lime. The rain while bringing acid in solution and so doing harm, also preserves by dissolving out the sulphate of lime and so preventing too much crystallisation.

A stone, therefore, which rapidly absorbs and evaporates stands better because of the washing out of the sulphate of lime. The durability of limestones can be very much increased by treatment with silicon ester. This binds together and protects the particles without closing the pores.

Limestone buildings should be washed down with the fire hose, especially under cornices and mouldings in the summer, being allowed to dry out, and then be washed again some two or three times.

A. P. LAURIE, Principal.

Heriot-Watt College,
Edinburgh.

The Imperial Institute.

Our attention has been called to the fact that in the obituary notice of the late Mr. T. E. Colcutt, by Professor Beresford Pite, in our issue of October 18, the writer referred to "The Imperial Institute building—temporarily, if not for good, the home of the University of London." The statement is perfectly true as it stands, since the University does occupy a large part of the main building and a small part of the extensive galleries behind it. But, we are informed, "it conveys the false impression that the University is in sole occupation and that the Imperial Institute is either elsewhere or defunct; whereas nearly half of the main building and by far the greater part of the galleries are, and will doubtless remain, in the occupation of the Imperial Institute, for whom they were built, and whose work of investigating, introducing to commerce and exhibiting the raw and partly-manufactured products of the Empire is of no less importance than that of the University."

THE ARCHITECTURAL ASSOCIATION

ON Monday evening, Mr. H. S. GOODHART-RENDEL (President) occupied the chair at the inaugural meeting of the 1924-5 session of the Architectural Association, at 35, Bedford-square, W.C.

In opening the meeting, the PRESIDENT referred to the recent death of Mr. A. H. Belcher, and it was agreed that a letter of condolence be sent to Mr. Belcher's relatives by the Association.

It was announced that there were 69 nominations for membership, and Miss M. Sauer and Mr. R. D. Manning were elected to the membership. Mr. P. M. Fraser was re-instated as a member.

Architecture of the Past and Future.

The PRESIDENT then gave an address entitled "Yesterday and To-morrow," in the course of which he said his lecture could not contain any just judgment or certain prophecy; what yesterday had done was done too lately for them to see it dispassionately; what to-morrow would do they could not see at all.

Very few people who employed an architect expected or desired from him a work of art, or indeed had any conception of what a work of art in architecture was. They thought they knew what they wanted already, and would like best to obtain it directly from a builder, afterwards ordering the decorative features *à la carte* from a furnishing firm. They employed an architect only to guarantee the safety of the structure and of the drains, and to see that the builder did not charge too much. They bowed to the necessity of his employment, but regretted it. It was to such unwilling patrons as those that most architects owed three-quarters of their chances of doing anything at all.

A great number of the buildings of the last half century that they now believed to be the best ones had been paid for by people entirely indifferent to architectural appearances. Besides those, a few of the very best of all had been built by people of exceptional artistic perception and had been profitably imitated by others. But there were still to-day among those who built—and Heaven be thanked for it!—many people who had no taste whatever, and who did not care two straws what their building looked like provided it served its purpose. For them the architect could do his best work, stimulated by his employer in his pursuit of efficiency and unhampered by him in his pursuit of beauty. The practice of many successful architects of deputing the designing of their buildings to subordinates, whether in or outside their offices, had made it often impossible for laymen or for anyone else to distinguish between the work of one firm and that of another. He feared, also, that architects had deserved heavy censure for a conventionality of outlook which only now showed slight signs of dissipating. In nothing was that more blameworthy than in their habit of spending their employer's money upon ornament which there was no chance of anybody ever looking at. He thought he could undertake to remove twenty thousand pounds' worth of architectural carving from the new Regent-street alone without any man, woman, or child noticing that anything had been done. The eye of the average Londoner was so glutted by architectural carving wrongly placed that even when such carving was properly called for he had come not to notice whether it was there or not.

He wished to speak of a most serious fault on the other side, of a defect in public taste which, if it grew rather than diminished, might paralyse their art altogether. That was the sentimental devotion felt by people of to-day for the arts of the day before yesterday—the cult of the "antique," the creed of the "period" designer. In that really beautiful thing, the Queen's Doll's House, they were leaving to posterity a record, cruelly true, that when they wished to offer their best in architecture, they offered architecture that was not theirs at all. He did not suggest for a moment that that was avoidable; the Doll's House was intended to represent the most educated taste of to-day, and did so exactly; but he did suggest that the most educated taste of to-day wanted a dose of something. Perhaps they could not stop people enjoining skilful craftsmen to make over and over again the mistakes which Kent or Chippendale or Sheraton made, but he thought they should try. Not only did that injunction sterilise any creative power the craftsman might possess, but it removed from his patrons the necessity of ever learning any artistic discrimination or indep taste. What was bad in decoration ture was worse in buildings; a "per was only a vulgarity, but a "peri was a grave misdemeanour.

Whatever its faults there was no was imitation antique about the ne street; nothing exactly like it had seen before, and it was to be hoped th like it would ever be seen again. That fare seemed to him, in spite of its to be peculiarly representative of thos yesterday upon which they must try that to-morrow turned its back. among them, he put its utter insinc believed that very few of the build were residential, yet the façades of of them were strongly domestic in above the level of the shop-fronts. really no excuse for that, since the on which his statement did not cover admirable building, on the west side below Conduit-street, which had be several years when the present activ That building was a fragment of a Mr. Verity for the general rebuildi part of the street in which it stood. design been carried out, then ten have been housed as well as or bette were housed to-day, and London gained a beauty. It would seem did they not see it to be true, tha publication of Mr. Verity's design the building of Selfridge's, of Wl Burberry's, and of the addition to Jo premises, the designers of Regent-s' return to the formulas which gave th Nicholl's and Harrod's Stores.

The one consoling feature in that failure of street building was the e many of the shop fronts. Even t them was not positively bad, a pleasant task to compare them v pleasant memory of those in the which they replaced. The shop fr future would probably be even s they had already become, since traffi were leading and would lead more their being recessed rather thar The great change, however, which would effect in the design of r shops would be the final disappear illogical distinction between sho super-structure which gave to su as that of Messrs. Dickins & Jones

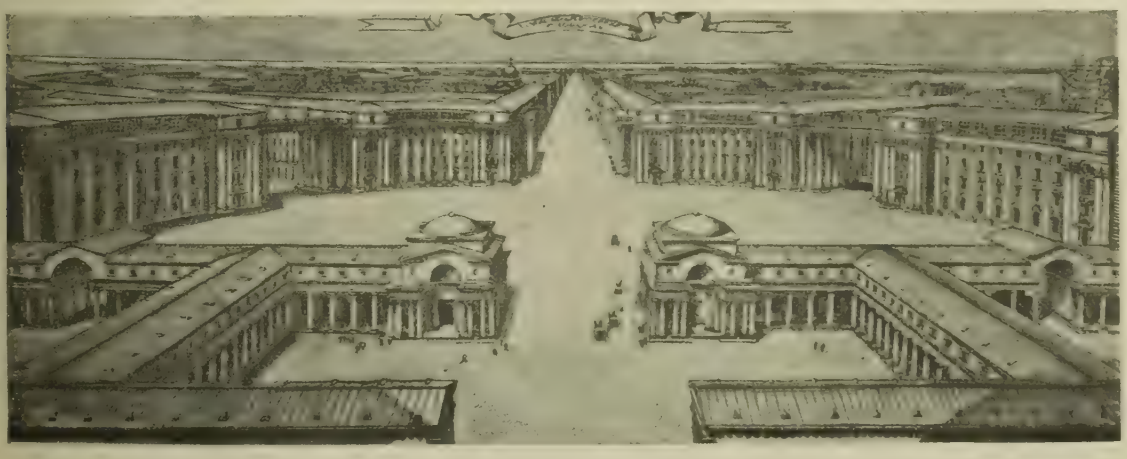
ing for safety in the "Earliest" style
ble, or covering their blunders in developed
by proposing a "free treatment" of
hichever course they embarked upon,
to be hoped they would remember that
ramount need of modern congregations
be able to see the altar without the use
of a periscope. Mediæval styles might be eligible for modern conditions, but most mediæval plans were not. It was true that mediæval plans had been constantly reproduced and that the accustomed docility of church-goers had saved them from rebellion, but he did not think there was any excuse for an architect, even with the acquiescence of his employers, building a church which it was hoped would be filled with worshippers at the chief offices in the form of an ancient church which was always too big for the worshippers at any one office, and in which, therefore, everybody had a large choice of where he would stand or kneel. Be its style Gothic, or Classic, or Romanesque, or nondescript, a modern church should take the form wherever possible of a large hall with or without passage aisles. Transepts were an expensive luxury, since they were seldom of any use, save as chapels, and for that purpose they were unnecessarily high. Whether there be added to this hall a full chancel or a mere sanctuary would depend upon whether there was to be a surpliced choir or whether the music was to be provided for from a western gallery. It could not be denied that that hall-like form was not a cheap one, unless they were to forego their normal notions of fit architectural proportion and make it very low. With modern facilities of ventilation, there was no practical compulsion to make such a hall of more than an average height of 20 ft., or even a little less; and it would be difficult to be content with that height for a space of about 40 ft. span. He suggested, therefore, that the really cheap church of to-morrow would probably be roofed by two or three parallel spans, and be divided accordingly by posts on their pillars on the ground plan. In some circumstances, wooden posts would do very well; in others, there might be an especial suitability in slender arcades of stone after the old model. Where the material was reinforced concrete there would be stanchions, which perhaps might be faced with mosaic, faience, or even marble. Where the material was reinforced concrete another new possibility in church architecture would arise—it would no longer be necessary to distribute the lighting area of glass into definite windows, but it would be open to the architect to pierce the walls and roof of his structure with glazed holes grouped and arranged in patterns however he chose. Before leaving the subject of church architecture, he must lay his tribute before that magnificent design which Sir Giles Scott had now partially realised at Liverpool.

In proposing a vote of thanks to the lecturer, Mr. H. M. Fletcher said he was very much interested in the reference to the concrete church at Le Raincy, which he had visited just previously, and which he thought a very fine piece of pioneer work, impressive in a way but still groping. The plan of that church was a traditional church plan of nave and aisles, but the aisles were only separated from the nave by thin reinforced concrete posts. The effect of the church might be likened to a bird-cage, for three of the sides were formed of very light

Part of proposed Spa at Leningrad, as built.



tracery in concrete filled in with glass; that seemed to be what Gothic builders tried to do but could not because the stone had not sufficient tensile strength, and they were obliged to use great buttresses outside. The external walls were simply a series of articulations with glass between, and with no projections on them at all. The interior of the church was very impressive. The coloured glass, of which the walls were chiefly composed, made the interior a blaze of colour. After referring to another concrete church in France, Mr. Fletcher said he thought everybody who cared for the to-day and to-morrow of architecture should keep their eyes on France.

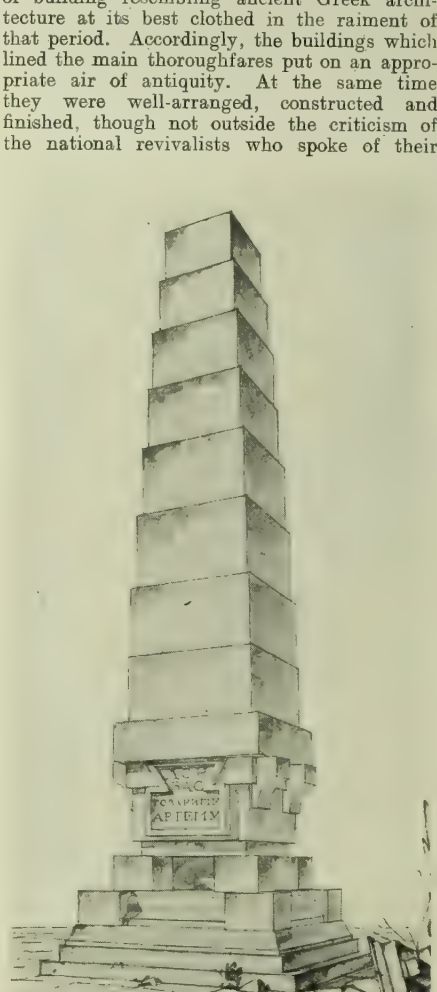
Mr. Matthew Dawson said he did not think the architects of the concrete churches in France came from the Ecole des Beaux Arts, but from the school of Viollet le Duc.

Mr. Manning Robertson said that in dealing with concrete churches or other buildings they got much the same type of structure as with steel, if they properly followed and properly used the material. He thought the Palm House at Kew a very fine building, but he did not admire Cannon-street station as architecture; both these were built of steel, and in the same way reinforced concrete structures could be beautiful if the material were properly handled.

Mr. Stanley Hamp said he thought a feeling of simplicity would have a large influence in the architecture of to-morrow, and ornament would be reduced to a minimum.

In replying to the discussion, Mr. Goodhart-Rendel said he quite appreciated that the architecture of Regent-street was the architecture of yesterday, and that most of the architects who had anything to do with it did so very unwillingly; the whole fault lay with those who imposed the design on the street. But the fact remained that Regent-street was about fifty years behind Kingsway, and in Kingsway there were some accidents!

The New Petrograd: Plan for a Spa at Leningrad. Designed by A. E. Fomin. (*See p.* 672.)



RECONSTRUCTION CONTRASTS IN RUSSIA

By HUNTLY CARTER.

When the war began much housing and town-planning and other civic work was being projected and carried out in Moscow and St. Petersburg (now Leningrad). At that period new building exhibited two tendencies, one towards a national revival, the other towards a classical revival. The first aimed at the re-introduction of a pure Russian style of architecture as a means of counteracting foreign styles which had crept into Russia since Peter the Great's time and promised eventually to turn Russian cities and towns into architectural museums containing a variety of styles outrivalling those even of Reval or Prague. The second aimed to rebuild Leningrad in "the triumph of the classical style."

The revival of the old spirit which represents the ethnic and ethic tradition in Russian architecture, and embodies those elements of racial experience which differentiate old Russian architecture from other national styles, found a very active and able supporter in the architect Alexander Schoussev. The ambitious new Kazan station at Moscow (see p. 674), which he planned and began to erect in 1913, and which is now, after a delay of nine years, being completed, is an example of an attempt to build a modern station in an ancient style. It is, in fact, an attempt to construct a great terminus, covering an area of half a kilometre and estimated to cost, in 1913, 12 million gold roubles, suitable for the purpose for which it is to be used, namely, a very heavy passenger traffic, and, at the same time, to reproduce a style that predominated from the fifteenth to the seventeenth century, in which there is a very considerable Tartar influence. In the latter respect the architect has been very successful. The building strongly expresses the old Tartar spirit in pathetic contrast to the new Western European "mammonised" spirit expressed by the numerous surrounding buildings. But the antique form hardly suggests the stern business of the building. Indeed, the exterior, of which the most prominent feature is the four-tiered tower revealing the typical old Russian motive, is pure decoration, and looks like an attractive toy. The interior, divided into a cavernous booking hall, waiting room, refreshment room, etc., is going to be ornamented in Byzantine style with a very lavish scheme of colour and, when completed, will strongly resemble the interior of a richly decorated Byzantine church. The Kazan station is an interesting expression of the union of ancient form and modern purpose. Whether the two agree is open to doubt. Woolwich Arsenal built in the style of the Kremlin might seem ironical and unserviceable. But Russia lies between Europe and Asia, between civilisation and barbarism, and perhaps to it will fall the task of synthesising the styles of the two.

A different result was attained in the case of the buildings erected in Leningrad. The latter city is of much more recent origin than Moscow, and, indeed, exhibits some of the best features of modern town-planning, including very wide boulevards and generous open spaces. The aim of its pre-war builders seems to have been to provide it with a body of building resembling ancient Greek architecture at its best clothed in the raiment of that period. Accordingly, the buildings which lined the main thoroughfares put on an appropriate air of antiquity. At the same time they were well-arranged, constructed and finished, though not outside the criticism of the national revivalists who spoke of their

A Worker's Monument.
Designed by A. E. Fomin.

"sham classical dressings." Perhaps the real fault of the Greek style was that of the national style. It was not altogether suited to modern purposes. Indeed, in some instances it seemed as though the main form of the building was not determined by purpose but by trimmings. An example occurs in the cinema theatres. Just before the war something gave a great impulse to cinema theatre building in Leningrad. Nevski Prospect became dotte picture palaces. There were both the t with large auditoriums, and the small more intimate theatres. These buildi not demonstrate throughout that certa ments governed the development and the cinema theatre. Whilst the seat commodation showed an appreciation latest requirements in the matters of comfort, convenience and sight line, the tectural treatment of the building show of appreciation of the ideas and ideal expressed. For one thing, there was deal of fussiness about the general For another, the exterior did not inv spectator into a cinema but into a And the interior decorations failed to the frame of mind necessary to the c enjoyment of the entertainment. As ample, take the Piccadilly Cinema. worthy of note that each of these new received a name, the "Piccadilly, "Soleil," etc., imported from bourgeois New York, and London. These names unchanged to-day, although the stree theatres and certain Government offic been rechristened with brand-new nam memorating the events of the Revolutio Piccadilly has a portico like a Greek It is enclosed by Ionic columns, and mented with Isador Duncan dancing The vestibule is richly decorated Greek and has a frieze ornamented with F medallions on a vivid blue ground. throughout the interior. The interior Soleil resembles that of an ancient bath. The red and black stuccoed wa ornamented with quite a lot of fancy work. With palace and domestic archi it is different. Examples of fit and n architecture are not uncommon. In par the buildings designed by the architect succeed in lifting themselves from th of too much embroidery and too little p

The work of this architect is well illu by the pre-war project for the build New Petrograd. The object was to spa or health suburb resembling F Buxton in plan and in severely classica tectural style. Briefly stated, it was er of the Proletariat, or, in Lenin's Power to the Soviets."

e now know, the conquest of the sie and the intelligentsia, or the old ial part of the population, was one of cts of the Revolution. The working l into revolutionary groups, the old asses were suppressed, dispersed and , and the proletariat became the y active class, demanding that Russia conditions of life should be fashioned suit their mental and physical re- ts. Hence arose a movement in ure expressing two tendencies, one a ial or psychological one, the other a tic one. The first aimed to embody national aspiration, namely, romantic power; the second was directed more national purpose or service. The latter efinite attempt to find architectural for the problems in connection with lding of Russia on a great Power plan, as an up-to-date electrically indus- country. And it was undertaken by g insurgent experimentalists.

st tendency found an embodiment in or, and the actual erection of public . monuments, etc.—a work in which ssional architects of the old *régime* accepted the new one were able to . Strangely enough, the new spirit roletariat favoured ancient forms. h forms the old intellectuals were miliar. But in place of a classical le, or an ancient Russian style, the t asked for a barbaric style coming y Rome and containing modifications y wanted to be used to help to express individuality. In the conception of uildings the first consideration must —the power of modern gladiators or a new existence and a new world. cular gladiatorial element has entered ly into the new architecture and and to-day evidences of it are to be Moscow and Leningrad, principally and busts of communist leaders— gles, Lassalle, Lenin, Trotsky, and nd monuments commemorating the ternational and fallen communists. ike a note of realism, solidity and us classicism of the Roman forum . Among the numerous projects for ldings are palaces of labour designed ding architects, including Fomin and ey are obviously inspired by the -Roman ideal and planned to take the place of the mediæval cathedral and town hall as the centralising buildings of Russian cities and towns. There are also designs for people's theatres, soviet municipal buildings, street decorations and embellishment. All alike exhibit a certain barbaric strength, simplicity and dignity which express the mechanical logic and orderliness, yet lack of refinement of the modern industrial worker. There is a permanent exhibition of these designs at Leningrad under the charge of the architect Ilien.

The buildings erected do not call for much comment. Probably the most important is the open-air theatre at Leningrad, built in 1920 from the designs of Fomin. It seats between 2,000 and 2,500 spectators, and was originally designed to seat 5,000, but lack of money compelled modification. A colossal statue of Labour guards the main entrance, which marks a definite departure in the direction of the ancient heroic ideal. The sculptor has sought to invest solid matter with the physical and emotional significance of the heroic or romantic labourer, and has avoided turning out the greasy-bloused mechanic and accessories on a pedestal.

The second and in some ways more interesting tendency in architecture occupies the attention of the young insurgents. They appear to be actuated solely by the modern idea of Service, and seek to design buildings suited for the highest efficiency of industry and State activities. They differ from the other architects in the following respect. While the first continue to exploit history and habit and tradition with up-to-date modification, the second accept only facts of a new creation and a new form which they seek to extend and develop to perfection. The first are producing, largely under the compulsion of the Government and public opinion, a new-old architecture subject to new social and industrial requirements, but the second are producing, encouraged by the Government, a new architecture to serve the new ends and purposes of the State, commerce, industry, traffic and transportation. That is, the latter want to reject, as far as possible, the basic forms and construction principles of antiquity and to realise the new possibilities of form and construction in new materials. These materials they have reduced to two—iron and glass—unlike the German insurgents, in particular Eric Mendelsohn, who is testing the possibilities of three materials—glass, steel and concrete—as illustrated by his book of "Structures and Sketches." The leader of the Russian experimentalists is Tatlin. The facts of his monument to the Third International nicely describe those of other projected buildings. In 1919 the Art Department of the People's Commission for Education requested Tatlin to make designs for a monument to the Third International. Eighteen months later he submitted a model and sketches to the eighth All-Russia Soviet Congress. He fully explained his project to the various Soviet representatives drawn from all parts of Russia. According to this explanation his project unites architecture, sculpture, painting and iron art-structure. It is to be built of iron and glass, the materials characteristic of our times. These materials have produced a change in the principles and use of architecture. Iron, for instance, although durable, can be put in any form. This makes the solidity and durability of a building independent of the conditions of the weight and support, which are transferred from stone and wood in the construction. Also, clever use of glass changes the problem of illumination and ventilation. Tatlin's monument was evidently designed with a full knowledge of the meaning and significance of the change in construction principles. It is 400 ft. high. It rises in the form of a spiral. It has an angle of 45 degrees, and it is divided into three stories, the walls of which are of glass. The first story is an immense square, which revolves round itself once a year. This is for International Congresses. The second story is smaller and pyramidal, and revolves once a month. It will serve for monthly meetings of the Soviets. The third story is in the form of a cylinder and revolves once a day. It is to be used for an information bureau. The revolutions and velocities are probably cosmic and romantic symbolism. They imitate those respectively of the earth round the sun, the moon round the earth, and the earth round itself. Another spiral building appears in G. Yakulov's project for a proletarian monument. The cylinder forms a radio station, below this is a beacon, below this again a library. Then comes a meeting-place, and the base forms a vast tomb. The latter is probably for some of the speakers and their victims.

In all this activity we see a desire on the part of young Russian architects to replace an individualist vision by a collectivist one. But the thing to note in the aforegoing, as well as in the new designs for peasants' huts exhibited at the Moscow Agricultural Exhibition last year, is the promise that Russia is about to form the subject of a great rebuilding scheme. The official plan adopted is to electrify the country from end to end. Villages are to be electrified and linked to each other and to the great cities by copper cables. Cities and towns will be brought into the general scheme and buildings supplied to suit the people and their needs. It will be interesting to watch Russia develop under the new architectural conditions. Not long ago there appeared in Moscow a design of the new Moscow rebuilt in a manner that made it look like ancient Rome at its giddiest height. To complete the picture, there was Lenin in a Roman toga.

Palace of Labour (Roman). Designed by A. E. Belogrub.

THE PLEASURES OF ARCHITECTURE*

UNDER this fascinating title the authors attempt to analyse the pleasures offered by the "at present much neglected art of architecture." We assume that the pleasures of architecture are keenly enjoyed by the architect (despite the penalties and disappointments inseparable from architecture as a profession), and we also assume that the chief object conveyed by the title of this book is to make a direct appeal to the layman, in the belief that if he derives pleasure from good building he will in turn take pains to see that he gets it. No excuse is required for a book of this nature to those who prefer a work of art to the written word; on the contrary, we believe that no greater service can be rendered to architecture than to attempt to bring the public into closer touch with its pleasures and its troubles.

We hardly think the authors have made the most of their opportunity by failing to distinguish between the pleasures of architecture to the onlooker, and the pleasures (or penalties) of possessing and living in a house designed by an architect. This is probably an instance of cause and effect which we are supposed to take for granted. Mr. Lucas, we believe, attributed to Charles Kingsley the observation that the beauty of the house opposite was of more consequence than that of the house one lived in, and we rather fancy that this practical observation represents the popular conception of the pleasures of architecture. This is not to depreciate the value of a fascinating book, but rather to define it.

The authors have adopted several methods in their handling of the subject, and their speculations cover a wide range. Individual observation and technical criticism, and a certain amount of special pleading, are delicately blended with vigorous and refreshing comments upon the social state. The psychology of architecture receives the attention it deserves, and the imaginary "Cedar Lawn" is a merciless piece of satire which eloquently portrays both a phase of architecture and the social state which produced it. This example will confirm the opinion of many who have held that the effective weapon for vulgarity is ridicule. We have seen it adopted with advantage, both in literature and on the stage, to deal with social problems and humbug.

We agree with the authors when they say that artists working for an indifferent public become yet more devitalised and a blight of indifference and boredom settles down upon the whole subject. We do not think, however, that architecture suffers so much from the lack of intelligent criticism, or even fashionable criticism and canvassing so common in the other arts. Architecture has nothing to gain from the intellectual community, described by the authors as being innocently housed in the "jerry-builders' most hilarious efforts."

Before arriving at the pleasures of architecture it is necessary to suggest the architectural influences which have gone to make English towns and villages what we find them in 1924, and this the authors have attempted to do. Our immediate predecessors in England, they say, built more houses than any other generation. "They were no fools; yet somehow between utilitarian economics and romantic æsthetics the products of their activities were towns such as Wigan, the Potteries, Hull or Leeds." The authors are perfectly clear about the "nameless horrors perpetrated by speculative builders," and as this is an issue which really confuses the whole problem we wish that more space had been devoted to it. If the speculative builder was responsible for these miles and miles of vulgarity, it seems to us to be idle to discuss whether the public has lost its architectural sense, or to write in vague terms about utilitarian economics. How are we to reconcile utilitarian economics (whatever they mean) with the Victorian trait which demanded to be housed "comfortably and unostentatiously" when we know that the opposite result was often achieved? "Cedar Lawn" may be symbolic of many things but architecture, but we do not believe it was born of utilitarian economics. The new "Cedar Lawn" on the opposite page, designed by the authors, is altogether delightful, and we would warrant is much cheaper than its tawdry predecessor. The ugly monotonous houses were there provided for us by the enterprising speculative builder, and apparently they were considered to be good value, or some other reason must be found for the supply and the demand. Surely this human foible (which is probably wrong) supplies the answer which the authors are seeking, to account for the "single swallow which year after year in this epoch has to suffice for the architectural summer."

In chapters 4, 5, and 6, the authors develop a closely reasoned analysis of the qualities which the art of architecture offers to the public. In these chapters the architect will find the various theories of architectural criticism brought up to date and summed up in an excellent manner. It is safe to say that this portion is not likely to be superseded for a considerable time. In chapter 10, the authors submit several examples of architectural criticism, which in their freedom from the jargon of pedantry and special pleading, are models for architectural critics. There are many thoughtful and contentious passages in the book which will provoke discussion for a long time to come. Here is a fine example:

"It will always indeed remain a debatable question how much right an architect has to plead a client's wishes in extenuation of a bad building, or a beautiful building in extenuation of a ruined client."

It is possible, as the authors suggest, that we may indeed be at the beginning of an architectural revival and that there is a new and lively interest in architecture. We would like to believe that this is so, even if we may be mistaking the true significance of the amount of building interrupted by the war,

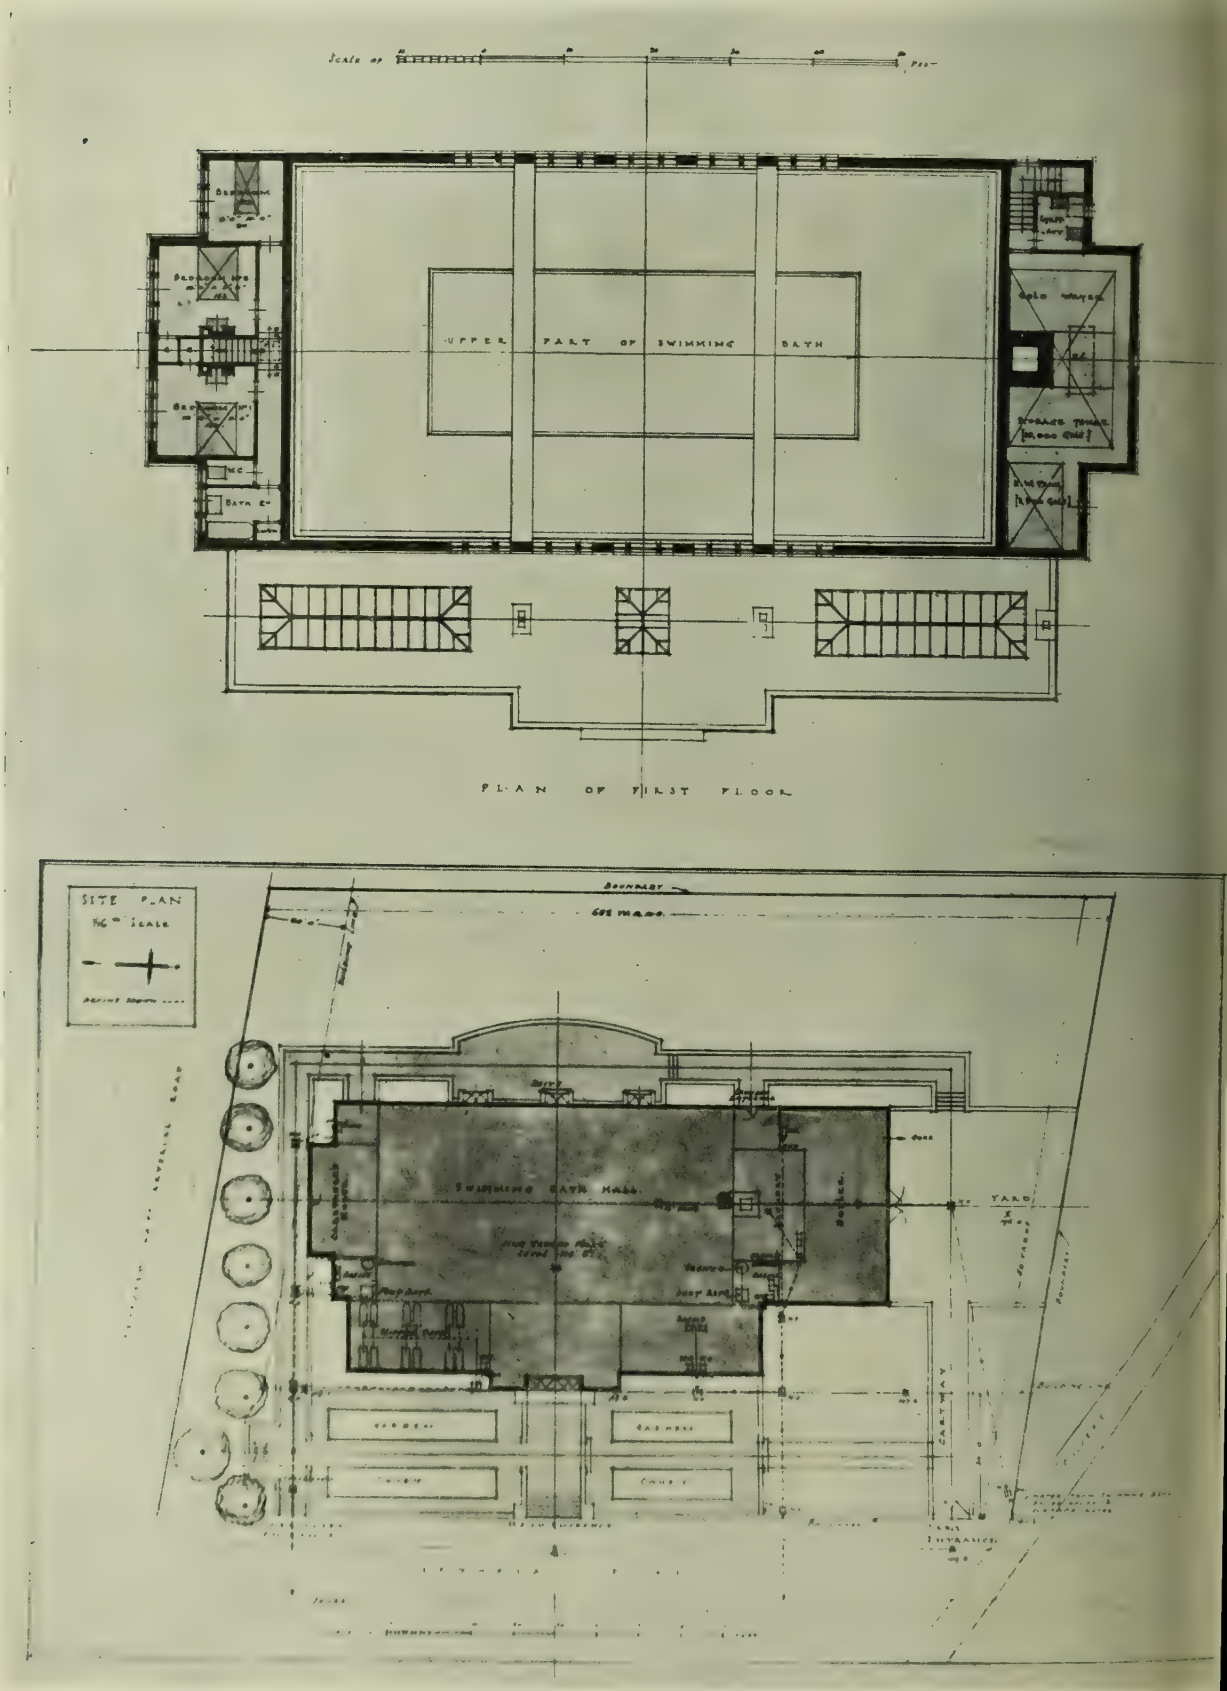
corridors. A lift connects to each floor. Spacious verandas surround the building. The architect is Major P. H. Keys, D.S.O., F.R.I.B.A.

Chigwell School, Essex.



The new War Memorial Chapel at Chigwell School will accommodate about 220 boys, and has been designed to harmonise with the oldest part of the present school, which was founded by Archbishop Harsnett in 1629. The walls are faced with 2-in. multicoloured red hand-made bricks, and the whole of the roof and fittings are of English oak. The choir stalls, headmaster's and chaplain's stalls are enriched with carved work. The interior wall space is white with the brickwork in the surrounds of the windows left exposed. The general contractors were Messrs. J. Bentley & Sons, of Waltham Abbey, the choir stalls, etc., being executed by Messrs. J. Hatch & Sons, of Lancaster, from the architects' designs.

The new stained glass windows erected in the chancel are the work of Mr. Reginald Hallward, and the subjects are taken from Bunyan's "Pilgrim's Progress." Figures of the schoolboys, as Christian's sons, are introduced to bring home the meaning of the allegory. The treatment of the windows aims to unite the technical methods of the fourteenth century and those of the sixteenth and seventeenth in definite co-relation. the main features being executed in coloured glasses (pot metals) with the addition of stain and ordinary pigment. To this is added the use of enamels for background, distant figures, etc., the less positive colour of the enamels contrasting with the stronger colouring of the glasses, and combining different characteristics, whereas the shapes to be leaded in the pot metals are determined by their different colouring. The enamels are fired into white glasses, the leading is on more vertical lines. These methods, although but the combination of age-long sources of treatment, yield ever new interest and discovery if t studentship of the work is intimate enough and directs the craftsmanship, which otherwise tends to the use and wont of custom only and becomes challenged as mere survival.

The architects are Messrs. Tooley & Foster, FF.R.I.B.A., of Buckhurst Hill, Essex.

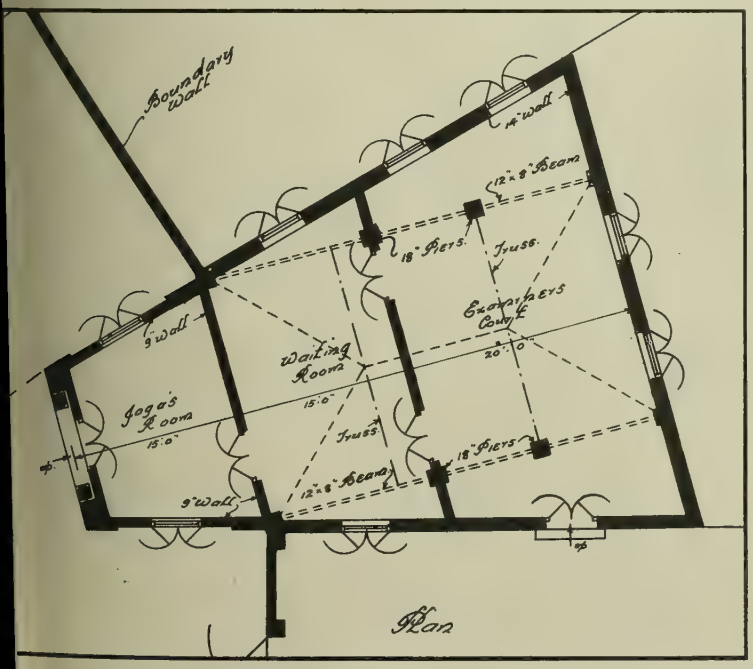
designs have been submitted in this tion, and the general standard of ex- is well above the average. In fact, ssessor (Mr. Arnold Thorne'y, .A.) has probably found some difficulty ing at a final decision, although his s been somewhat lightened—or so it —by having to overlook several excel- signs, because of the impossibility of them for anything approaching the ggested in the conditions, viz.: £15,000. e this amount was not made obligatory mpetitors as they were invited to give vn estimate of the probable cost, but cal planning has obviously influenced rd, and few will cavil at this important eing given serious consideration.

site is well adapted for its purpose, a fairly rapid fall from south to north, ictoria-road running parallel to its boundary. A possible new arterial s indicated on the southern side of the disposal, but competitors were asked ge for all entrances to face Victoria- d this proviso has naturally influenced nning. The conditions further sug- at six of the twelve slipper baths could, esired, be provided in the form of a xtension as well as the gallery in con- with the main bath hall. It is on these nts, and the probable cost, that many competitors have broken down. They ely separate the future slipper baths ose first provided with a consequent ion of lavatory and, in some instances, room accommodation. Moreover, such gement puts additional work upon the nt in charge, makes supervision diffi- even entails the engagement of two nts when one would probably suffice.

osition of the two club rooms asked for in proved a stumbling block. Their use as competitors' dressing rooms in ion with swimming galas or as platform rooms, when the bath hall is used lic meetings or entertainments, seems been entirely overlooked by many. h the caretaker's house have a large gone rather astray by providing it in n of a completely detached residence, thus making supervision difficult and enforcing its occupant to traverse the open to attend to his daily duties. Some of the foregoing items may, perhaps, be considered to represent minor details, but they have all been successfully overcome in the designs placed first and second, and the third only fails in so far as the club rooms are concerned.



The prohibitive cost of many of the schemes has already been referred to; suffice it to suggest that prices varying, as in many instances they do, from between ninepence and one shilling per cube ft., and covering not only the buildings but all engineering work, are surely quite inadequate nowadays.

Taking the foregoing factors into consideration, there can be little doubt that the first premiated design (by Mr. C. Cowles-Voysey, A.R.I.B.A., of London) merits its position. The plan is simple, well-balanced, and straightforward. The central top-lighted entrance hall gives access to the swimming pond, which is placed with its length parallel to Victoria-road and the deep end to the north, thus taking full advantage of the natural fall of the site. Direct access from the entrance hall is also obtained to the slipper baths, waiting room, and attendant's room, as well as the office and club rooms. These apartments, one story in height, extend the full length of the bath hall, and are placed in front of it. They are most excellently arranged both as regards balance of parts and administrative convenience. The attendant's room is in direct touch with the entrance hall, the slipper baths and the swimming pond, thus allowing of most adequate control by one individual—an obvious advantage. The problem of future extension of the slipper baths is also satisfactorily solved, and the club rooms are conveniently placed for service as competitors' dressing rooms in connection with swimming galas or as platform retiring rooms when the bath hall is utilised for public meetings or entertainments. The caretaker's house, built against the southern wall of the main bath hall, and thus obtaining a sunny aspect for its principal rooms, has its own entrance and is also given direct and convenient communication with the main building. The laundry, placed at the northern end of the bath, with boiler-house, etc., under, and extending beyond it, is obviously rightly placed. The planning of this portion of the building can again be commended. The accommodation is adequate in every way, and convenient installation of the boiler or even its removal, if this should at any time be necessary, has not been lost sight of. This is more than can be claimed by a large number of the competitors. The swimming pond is surrounded by an adequate number of dressing boxes and its lavatory accommodation is satisfactory. The gallery, required by the conditions as a future extension, is provided outside the bath hall, and runs the full length of its northern side. To effect this, of course, necessitates the eventual removal of the external wall, but in order to facilitate the operation it is suggested that the steelwork required to carry the roof principals, etc., be at once built in position. Perhaps on the whole this constitutes the most convenient method, although it necessitates the removal of a number of the dressing boxes which the author proposes to replace behind the top tier of the gallery steps. It is just a question if they are not then rather out of touch with the swimming pond, and because of this a position under the gallery with access obtained from a corridor, thus allowing the boxes to be on the same level as the pond, seems a possible alternative.

The elevations are of exceptional merit. They are simple in character, the detail is refined, and the materials suggested, brick walls and stone dressings with a pantile roof, if sympathetically handled, should result in a most satisfactory building. This again, is one of the few designs submitted in which all four façades are of equal value, a factor which has probably influenced the award to a certain extent. A few minor points will doubtless receive further consideration when the final drawings are prepared. The caretaker's house lacks a secondary entrance, and difficulties with the ash and refuse bin are at once apparent, unless indeed this necessary commodity finds a resting-place outside the front entrance door. This defect is, however, to be found in all the designs where the house is placed on an upper floor. The roof principals and window openings to the bath hall will again require remodelling in order to bring them into line with the stanchions proposed to be built into the northern wall for the purpose of the future gallery. As now arranged, these stanchions bear no relation to the principals, and consequently the hall interior would suffer both from a constructional and æsthetic standpoint.

The bath subways may also require attention. These are only provided along one side and one end of the pond. This has probably been done for reasons of economy, but subways on all four sides certainly seem desirable, if not absolutely necessary. In fact, practically every other competitor has considered this arrangement to be essential. Neither again does the necessary aeration apparatus appear to have been provided. These, however, are all remediable items, and the assessor has certainly selected the best design submitted from an all-round standpoint of plan, elevation, and comparatively moderate cost.

The plan of the second premiated design (by Messrs. Quiggin and Gee, F. & A.R.I.B.A., of Liverpool) is conceived on very similar lines both as regards the disposition of the bath hall, slipper baths, club rooms and caretaker's house. The arrangement of the latter is, in fact, superior and represents the best solution submitted in the competition. The attendant's room is also very well placed, and so are the club rooms. The future extension of the slipper baths is again most ingeniously handled. The plan, however, suffers when compared with the first premiated design in the duplication of entrances, and the position of the laundry and boiler-house, etc. The second entrance becomes necessary to serve the club rooms, and although a reason is found for its introduction by utilising it for access to the future gallery staircase, it presents a some-

New General Hospital, Singapore: Examiners' Court.

MAJOR P. H. KEYS, D.S.O., F.R.I.B.A., Architect.

what extravagant feature. The boiler house again suffers from being placed at the south-west corner of the building, thus necessitating additional excavation, and it appears that the boiler would have to be placed in position before the chamber containing it was roofed in. Even if built up in sections, getting these sections inside the building would prove an arduous undertaking. The tank room again appears to have been quite overlooked. The bath hall is generally very well arranged, although the lavatories are rather on the small side, and the lighting and ventilating of one of them into the covered way of the caretaker's yard is not ideal. The future gallery is provided over the dressing boxes on three sides of the bath hall, a method favoured by many of the competitors. On the face of it this appears a simple arrangement, but the introduction of the necessary steel work would certainly involve a considerable amount of disturbance to the bath hall, and consequent expense. It would further necessitate closing the bath during the time the operations were in progress. For these reasons the arrangement suggested by the first premiated design appears on the whole to be preferable.

The elevations are quite interesting and represent a typical example of the restraint in design that is now so fashionable. What a change from the applied columns, pilasters and ornament of years ago! The eastern façade, in fact, consists entirely of blank wall with the exception of the two entrance doorways, one small window opening at the ground floor level and three small windows lighting the upper part of the bath hall, which would, moreover, be scarcely in evidence from the road. Such restraint is so refreshing that it might almost seem hypercritical to suggest that it has been carried to excess. At all events, the provision of this blank wall space has necessitated top lighting to the waiting room, club rooms and the w.c. and lavatory planned in connection with them. Windows could, in each instance, have been introduced, and by so doing the rooms in question would certainly have benefited, and perhaps the elevations also, although again this is admittedly a question of personal taste. The south elevation is an interesting composition, and so is the north, although dependent on future extensions for its balance. The materials proposed for use also duplicate the successful design. In fact, the three selected all favour pantile roofing, as do the majority of the competitors. May it be suggested that the assistance this material renders to the draughtsman in adding to the interest of his drawings influences its selection?

The third premiated design (by Messrs. Edwards and Thrasher, of Bristol) breaks away. The bath hall, again running from south to north, is in this instance exposed to view, and its eastern wall consequently forms a dominant feature in the design. The entrance hall, slipper baths, and club rooms are all placed at the southern end of the bath hall, with the caretaker's house over the main entrance hall, office, and attendant's room, and the laundry under the club rooms. The question of administration does not appear to have been given very careful thought. Three attendants' rooms have, for instance, been provided, one serving the slipper baths, one the swimming pond, and the third the entrance hall. The latter, in fact, seems quite unnecessary, and appears to have been introduced to find a purpose for a surplus room. The same criticism applies to the lavatory and cloak-room approached from the entrance hall. All 12 slipper baths are provided in the first instance and are arranged in an E-shaped block, the middle stroke of the letter forming the waiting room. The corridors, therefore, have right-angled turns, and adequate supervision is consequently made difficult. The club rooms, again, placed as they are at the shallow end of the swimming pond, are out of touch for use in connection with swimming galas or as platform retiring rooms. Access to the caretaker's house is only obtainable from the main entrance vestibule, and this is not quite as good an arrangement as an entirely separate approach. The laundry, also, suffers in its lighting and ventilation by being placed underground, and being at the opposite end of the building to the boiler-house, engineering problems are somewhat complicated.

This boiler-house, however, is rightly placed and its general arrangement and accessories are very good indeed. So also is the main bath hall. A diving annexe at the deep end forms a useful and interesting feature, and the lavatories are very well placed and planned. The gallery is not as satisfactory. As proposed it necessitates the temporary removal of the dressing boxes for the entire length of two sides of the bath and the fixing of two rows of raised seats. Such a method would entail a vast amount of labour and consequent expense. The bath hall is, however, of sufficient height to allow of a future gallery being introduced above the dressing boxes if and when required —on the face of it a preferable arrangement. The elevations are quite interesting, and the main entrance block, with the caretaker's house over, forms a very satisfactory group indeed. The bath hall, being such a prominent feature in the design, has prohibited a balanced façade, but this portion is very capably handled. Blank wall is again a dominant note, and again it may reasonably be asked if some attempt at fenestration would not have added interest to the design, to say nothing of natural ventilation to the bath hall. The elevations are beautifully drawn, and good draughtsmanship is, in fact, a feature of all the premiated designs. It has not gained them their high position, but it has certainly assisted to the extent of allowing their wares to be displayed to the best advantage.

Design No. 42 represents a very capable and interesting solution of the problem, and generally follows the lines of the three premiated designs. The author has taken a vast amount of thought and trouble as he submits additional plans showing the bath arranged for swimming entertainments and as a public hall; the club rooms being most ingeniously converted into cloak rooms for the public. Platform retiring rooms have, however, to take the form of an extension over the future slipper baths and a supper room and kitchen, etc., is also introduced as a possible addition although not asked for. The caretaker's house takes the form of a completely detached building, thus making supervision and cleaning duties difficult. The elevations are well drawn and would have come out well in execution.

Design No. 1 is, again, on similar lines, with a very satisfactory caretaker's house, excellent bath, lavatories, and the boiler-house at the lower end of the site. The club rooms require a separate entrance, and the author is again to be numbered with those who have failed to see the advantage of the attendant supervising both the bath hall and the slipper baths. The elevations are quite satisfactory, although they do not strike an original note.

The plan of No. 30 is again on similar lines to those already mentioned, but with the boiler house, etc., at the wrong end of the site, viz., the south. The attendant can not control the slipper baths and the main bath hall simultaneously, although this could have been obviated. Two separate entrances have had to be provided for the club rooms. The caretaker can only obtain access to his house from the bath entrance hall, and it is suggested that the general public use his staircase for access to the future gallery, which constitutes an unsatisfactory feature. The plan has, however, many good points, but the elevations are of rather an ordinary type.

In No. 8 the bath hall is placed at right angles to Victoria-road, the main entrance hall being at one end and flanked on each side by the office and one of the club rooms, the caretaker's house taking the form of a flat approached by a separate entrance and placed over them. The gallery is made part of the scheme and runs along the northern side of the bath hall, the laundry, lavatories, and remaining club room being plac The boiler-house is a detached bu is a very economical scheme with elevations, but it fails in a details.

No. 60 is another very well-dr satisfactory elevations. The clu however, much larger than asked design generally suffers from ov of its component parts. Because prices per cubic ft. are very low they do from 7d. to 1s. 2d. in or an estimate of £15,007. The many good points, but a total c of 300,500 ft. has probably prov handicap to its chance of success

No. 23 is another excellent set with really good elevations, bu have blemishes, by reason of u access to the gallery and somewha lavatories and footbath accommod nection with the bath hall.

The plan in No. 17 is of much than the elevations. The entra arranged, and this also applies taker's house, club rooms, lav slipper baths. The latter are, h as much too high as the bath hal In order to allow these slipp balance the two-story caretaker's are given an exactly identical hei the bath hall is only 8 ft. 6 in. h floor line to the springing line of is a very economical scheme, but i capacity is much helped by the height of the main hall.

No. 25 is a good all-round handicapped by its dual entrances sence of a ladies' lavatory, es mixed bathing is contemplated. F reason the grouping of all the foot baths together is not quite neither is the attendant very well elevations are, however, quite go

The elevations of No. 29 are higher standard than the plan, w from a rather extravagant main c slipper baths are, however, well ar this also applies to the lavatorie attendant is badly placed, a defect in many of the designs.

No. 35 is another capital plan slipper baths and club rooms, a attendant is not well placed, and is on the small side. The careta suffers from being detached, its l lighted, and a w.c. and space fo pears to have been forgotten. Th can also be highly commended cellently rendered, but this does the caretaker's house, which is character with the rest of the w describe it as a very mediocre ef criticism.

No. 44 is an original type of pl hall being placed on an axial lin right angles to Victoria-road and arterial road, and having two side ning parallel with these thorough arrangement, ingenious as it breaks down badly if this arterial developed.

The competition has undoubted success. A very large number of designs have been received, and fr them the assessor has certainly best all-round solution of the p sented.

LEGAL SECTION

NOTES ON CURRENT CASES

Act Time Limit for Recovery of Rent.

ur issue April 18, 1924, we noted the n of a Divisional Court in three cases, . McKay, Algate *v.* Vugler, and Clark *v.* all of which turned upon the meaning of rd "recoverable" as used in section 8 ion (2) of the Rent Act, 1923, which into law July 31, 1923. The claims were which, it was alleged, was overpaid in e, we assume, that it was rent irrecover- the landlord, but the facts are not fully l. By section 14 subsection (1) of the ct. 1920, it is provided that "where any s, whether before or after the passing of , been paid on account of any rent which rtue of this Act, or any Act, repealed by . irrecoverable by the landlord the sum shall be recoverable from the landlord." section contained no time limit, but the ct. 1923, in section 8 subsection (2) a time limit for recovery of sums under 14 of the Act, of 1920, as it provides: ım paid by a tenant or mortgagor which ıbsection (1) of section 14 of the principal ecoverable by the tenant or mortgagor recoverable at any time within six from the date of payment but not after- r in the case of a payment made before ing of this Act, at any time within six from the passing of this Act but not ds." In the above three cases a al Court held that the word "recover- s used in the subsection did not mean gment must actually have been obtained t proceedings by writ or summons ıve been commenced within the six period prescribed.

case of Diment *v.* Roberts and Another *mes*, July 24), this same point was before the Court of Appeal, and the Appeal affirmed the judgment of the low, which had followed the decision in McKay and the other two cases, and they may now be taken to have the of the Court of Appeal. In this case the s were alleged to have been made before ng of the Act of 1923, and proceedings er them had been instituted by plaint ounty Court on January 24, 1924, but did not come on for hearing until 24, and then was adjourned until . The Court of Appeal intimated that possible to suppose that the legislature to leave the tenant's right to sue t upon the state of business in the d held that the word "recoverable" the initiation of proceedings within prescribed.

the method of calculating the time in ıg the period of six months, a point as as decided in another case, Truss *v.* *The Times*, April 17, 1924). In this ummons had been issued on January 31 risional Court held, following a decision urt of Appeal in Goldsmiths' Company Metropolitan Railway Company (1904,), that the proceedings were taken in he day the Act comes into operation is in the computation of time.

me limit, when a notice of increase has nded and made good under the Notices leal with this point in a note on the ams *v.* Britannic Merthyr Steam Coal (1924, 2 K.B. 324) on p. 686.

Rent for Furnished Room.

e Truss *v.* Olivier, in which this point d was a case which turned on section 9 of 1920, upon which there have been ons. The rent that was alleged to be was in respect of four furnished rooms the plaintiff had become tenant in 1921, at a rent of £1 a week. In June, plaintiff had taken an extra attic for 2s. 6d., and had continued to pay the weekly rent of £1 2s. 6d. until November 24, 1923, and then, apparently, had alleged that the rent was excessive, and on January, 1924, had issued the summons in this action. Section 9 of the Act of 1920 provides, "Where any person lets, or has, before the passing of this Act, let any dwelling-house to which this Act applies, or any part thereof, at a rent which includes payment in respect of use of furniture, and it is proved to the satisfaction of the County Court on the application of the lessee that the rent charged is yielding, or will yield, to the lessor a profit more than 25 per cent. in excess of the normal profit as hereinafter defined, the Court may order that the rent, so far as it exceeds such sum as would yield such normal profit and 25 per cent. shall be irrecoverable, and that the amount of any payment of rent in excess of such sum which may have been made in respect of any period after the passing of this Act shall be repaid to the lessee."

Then subsection (2) defines the "normal profit" as follows: "For the purposes of this section 'normal profit' means profit which might reasonably have been expected from a similar letting in the year ending on August 3, 1914. The County Court judge had fixed the proper rent to be paid under this section at 12s. 6d. a week and the Divisional Court had said that although it was not clear how this sum had been arrived at, the judge had not misdirected himself on principle, and as it was a question of fact for him to decide, the appeal must be dismissed, but the Court proceeded to explain the correct principle to apply which was to ascertain the normal profit produced from the furnished letting in 1914; then to estimate what rent would produce that profit when the case was heard, which would be considerably higher owing to the increased expenses which have to be incurred, and then to add 25 per cent. of this profit to the total.

Mortgagor and the Rent Acts.

A case, Jenkinson *v.* Wright (*The Times*, July 29) very shortly reported, appears to have raised a new point under the Rent Acts. The appellant held a lease of a house for 99 years, of which period 31 years remained to run, and the respondent held from him one room in the house. It appears that the appellant had obtained possession of the house, or was in possession at the time the Rent Restriction Act was passed in 1923, and under section 2 subsection (1) of that Act claimed that the house was decontrolled. The appellant had at some time, not stated in the report, mortgaged the lease and had attorned as tenant to the mortgagee, and the County Court judge appears to have held that this transaction had made the appellant a tenant, and therefore he could not claim that the premises were decontrolled under section 2 subsection (1) of the Act, 1923, because he was not a "landlord." The argument for the appellant seems to have been based on two separate grounds (1) that the mortgage did not render the appellant a tenant and (2) if it did that section 12 subsection (7) of the Act of 1920 applied and the premises were not protected.

The Divisional Court appears to have considered a third point whether a lease holder of a long lease could be called a "landlord."

The Divisional Court allowed the appeal, and Justice Rowlatt's judgment seems to dispose of the first point the most satisfactorily, as he held that the ground upon which the County Court judge had based his judgment was wholly unreal because the appellant was not in possession by reason of the attornment as tenant to the mortgagee, but because he was owner of the property, and both Lord Darling and he held that as the mortgage was a subdemise at a peppercorn rent there was no control under the Rent Act, 1920, by reason of section 12 subsection (7) as the rent was less than two-thirds of the rateable value. On the third point Lord Darling intimated that because the appellant only had a leasehold interest it could hardly be maintained that he was not a landlord, for the same argument would apply to a person who held a lease for 999 years, and the test could not be whether the owner held in fee simple or on a term of years. Mr. Justice Rowlatt left this point open, but said it might well be that section 12 subsection (7) excluded that point also.

Section 12 subsection (7) is rather obscure as it provides "Where the rent payable in respect of any tenancy of any dwelling house is less than two-thirds of the rateable value thereof this Act shall not apply to that rent or tenancy, nor to any mortgage by the landlord from whom the tenancy is held of his interest in the dwelling house, and this Act shall apply in respect of such dwelling house as if no such tenancy existed or ever had existed." It is to be observed the Act applies to the house but not to the tenancy, therefore the house appears to come within section 2 subsection (1) of the Act of 1923, and can be decontrolled. The case as the Court observed raised a troublesome and difficult point, and we hope it will be reported at greater length for it is difficult to follow. We must remind our readers that, as we pointed out in our article of September 5, the Prevention of Eviction Act has affected the right to obtainning possession and may affect the right to decontrol. The effect of that Act, section 1, briefly stated is that as regards pending as well as future proceedings the grounds for obtaining possession contained in section 4 subsection (1) paragraphs iv and v of the Act of 1923 have been tightened up, and where an order or judgment has been made under the law as it previously was, but not executed, it can be rescinded.

This Act is very difficult to interpret, and it has not yet been the subject of legal decision. For instance, the new paragraph which takes the place of paragraphs (iv) and (v) commences "where the dwelling house is reasonably required by the landlord (not being a landlord who has become landlord by purchasing the dwelling house or any interest therein after May 5, 1924). . . ." but the subsection applies to "future as well as pending proceedings," What, then, is the position of the landlord who purchases after May 5, 1924? As the new paragraph does not apply to him and the paragraphs now contained in section 4 of the Act of 1923, numbered (iv) and (v) are repealed if he requires possession he can only apply under paragraph (*d*), which contains much more stringent conditions as to alternative accommodation. Then, as we have before pointed out, a difficulty arises in connection with section 2 subsection (2) of the Prevention of Eviction Act. Subsection (1) gives the courts power to rescind an order or judgment made or given before the passing of the Act, but not executed, if in the opinion of the court it would not have been made or given if this Act had been in force at the time it was made or given, and subsection (2) provides "Where a landlord has on or after April 15 taken possession of a dwelling house under a judgment or order so rescinded as aforesaid, such possession shall not in any case exclude the dwelling house from the operation of the Rent and Mortgage Interest Restriction Acts, 1920 and 1923.

We referred to this subsection in our notice of the Act in our issue September 5, when we pointed out it was difficult to see how a landlord could take possession of a house under an unexecuted order or judgment which is the only order or judgment referred to in subsection (1), but there is a further difficulty for if he can take possession in such circumstances, then subsection (2) provides possession shall

not exclude the house from the operation of the Rent Acts, 1920 and 1923. We find it difficult to suggest any interpretation which will explain the effect of this subsection. Suppose the landlord can take possession under an unexecuted order or judgment it is to be assumed the legislature intended that in the case of a landlord doing so after April 15, 1924, his possession would not apply to take the house out of control under section 2 subsection (1) of the Act of 1923. But if so the subsection does not carry out such an intention as it merely provides "such possession shall not exclude the dwelling house from the operation of the Rent Acts, 1920 and 1923," but section 2 subsection (1) giving decontrol from possession is an integral portion of those Acts. This subsection affects all landlords taking possession after April 15, 1924, and we hope some judicial interpretation may soon be placed upon its provisions as it certainly affords a most extraordinary example of drafting even in an age of obscure drafting.

RENT RESTRICTION

Amended Notices. Arrears.

THE case Williams *v.* Britannic Merthyr Steam Coal Co., Ltd., which we referred to in our issue August 15, is now fully reported in the Law Reports (1924, 2 K.B. 334), but we still find the case very difficult to follow, and it certainly serves to illustrate the confusion which has been imported into Rent Restriction by a continuous stream of Statutes. We will endeavour to state the case as shortly as possible.

The plaintiff was the tenant of a dwelling-house the standard rent of which was 7s. a week, the landlords paying rates and taxes and doing all repairs. He was in the employ of his landlords and the rent was deducted each week from his wages. The plaintiff claimed in this action that amounts in excess of the standard rent had been deducted and that these amounts were, therefore, irrecoverable by the landlords and recoverable by him, and he claimed an account and repayment of the excess over the standard rent.

The manner in which this question arose was that the landlords had served four notices of increase of rent dated respectively February 4, 1920, September 29, 1920, July 11, 1921, and August 26, 1922, but these notices were all defective and except as to the last of them contained no notice to quit. Section 6 subsection (1) of the Act of 1923 gives the county court a discretion to amend notices of increase if satisfied an error or omission has been made by a bona-fide mistake, and acting under this subsection the county court judge amended all the notices except the first, the amendments to take effect from the date of the several notices. The question then arose who was entitled to the sums deducted since the first notice under the three notices as amended, and the county court judge had held that all monies paid under the notices made good could be retained by the landlords.

On the appeal to the Divisional Court the tenant contended that under section 8 subsection (1) of the Rent Act, 1923, the landlord could only retain payments made within six months of the date of the order, for that subsection provides "No increase of rent which becomes payable by reason of an amendment of a notice of increase made by order of the county court under this Act shall be recoverable in respect of any rental period which ended more than six months before the date of the order." The Divisional Court held that the powers of amendment conferred by section 6 subsection (1) of the Rent Act, 1923, extended to making the notices of increase notices to quit within the Notices Act of 1923, and that the effect of section 8 subsection (1) of the Rent Act, 1923, was to limit the period during which rent payable under an amended notice could be recovered to within six months of the order. Sums paid before that period were therefore "irrecoverable" by the landlord under section 1 of the Act of 1920, and "recoverable" by the tenant under section 14 subsection (1) of the same Act.

It is to be noted that the notices of increase in this case were defective in r spect of several errors and, therefore, were not good notices which under the Notices Act of 1923 would operate as a notice to quit (see Aston *v.* Smith, *The Builder*, August 22, 1924). If they had been good notices, then it appears from Landrigan *v.* Simons (*The Builder*, October 3, 1924) that the time limit in the proviso to section 1 subsection (1) of the Notices Act would have applied. Still, we find the case difficult to follow for the following reasons. In the first place, it is difficult to follow from the report why the court held subsection (2) of section 8 of the Act of 1923 to have no application to this case. That subsection provides, "Any sum paid by a tenant which under subsection (1) of section 14 of the principal Act is recoverable by the tenant shall be recoverable at any time within six months from the date of payment, but not afterwards or in the case of a payment made before the passing of this Act at any time within six months from the passing of this Act, but not afterwards." Subsection (1) of section 14 of the Act 1920, refers to sums "irrecoverable" by the landlord. These sums were not paid by the tenant but they had been deducted from his wages which would appear the same thing. Secondly, there is this further difficulty for subsection (3) of section 8 of the Act, 1923, enacts, "Nothing in this section shall affect the operation of the Rent Restriction (Notices of Increase) Act, 1923."

Now the Court acted under this section (8) as regards the time limit to be applied to an amended notice, which was a notice which could never have been held good but for the provisions of the Notices Act, for before that Act was passed a notice to increase was of no validity unless preceded by or accompanied with a notice to quit, and under the provisions of the Notices Act it is provided that "Nothing in this Act shall entitle a landlord after the passing of this Act to recover from a tenant in respect of any period before December 1, 1922, the increase of rent made valid by this Act, or any sums which have been recovered from the landlord before that date by means of deductions from rent or otherwise, or any rent due before that date which has not been paid by reason of such deductions having been made therefrom; but section 14 subsection (1) of the principal Act shall not apply to an increase of rent made valid by this Act, which was paid by or recovered from a tenant prior to December 1, 1922." It is section 14 subsection (1) of the principal Act that the Court acted upon as making the sums recoverable by the tenant under notices of increase which, though amended under section 6 of the Act of 1923, could have had no validity but for the provisions of the Notices Act, yet a time limit was applied under the Act of 1923, and not according to the provisions of the Notices Act. The intention of the Legislature when the Notices Act was passed was to crystallise the position from a certain date and to let neither landlord nor tenant go behind that date.

We are, of course, not questioning the decision of the Court, but the law has to be understood and acted upon by laymen, and our only intention has been to show the extreme difficulty there is in deriving from this decision as reported any certain guide to the intricacies that have been imported into Rent Restriction legislation.

New Kilburn-Hammersmith Sewer.

The preliminary work involved in the preparation of drawings and specification in connection with this scheme has been pressed on and tenders will be invited at the earliest possible moment. The estimated cost of the work, including expenditure not provided for in the contracts, amounts to £527,000. The work will occupy about two and a-half years and the expenditure will, it is anticipated, be incurred as follows:—Financial year 1924–5, £30,000; 1925–6, £200,000; 1926–7, £200,000; 1927–8, £97,000.

FRANCO-BRITISH UNI OF ARCHITECTS

WE gave last week an account of the annual meeting of the Franco-British of Architects at the rooms of the Soci Architectes Diplômés, Paris, on Octob

At the official banquet in the evenin sieur Godefroy, President, after propos loyal toasts, gave an address of welc the British delegates. In the course remarks he said the British Amba although not able to be present with had demonstrated the interest whi British Government continued to tak Union which would do much to promo dial relations between the two cou Their own Minister of Foreign Affai Premier, also regretted his inability with them. They had no doubt he wa acquainted with the aims of the F British Union of Architects, more parti as they knew his personal interest " rapprochement des intellectuels " nations. They would, therefore, have particularly happy to have welcomed there that night, and he asked his repr tive, Monsieur Roussel le Roy, to con Monsieur Herriot their thanks and gre Their chairman, Monsieur Paul Leon represented the Minister of Fine Arts, d strated by his presence his lively inter their Union.

Although the Franco-British Unio Architects was only officially formed in it was hardly necessary to remind them the Union existed in fact in 1913 as a of the manifestations which then took in London and Paris, and which serv establish cordial relations between F and French architects. Rarely, he th had there been a time when it had been essential that they should continue t together. Thus their Franco-British should be, for both countries, an inexha well of friendship. He would like to the future others coming into existen similar lines between the artists and w of both countries. Unfortunately, as were well aware, there were other all springing into existence, the alliance o and gain, of which neither their heart their minds could approve. If, therefore were successful as the leaders of su movement they would only be acting i cordance with the objects of their society

Were they not, indeed, as architects, at the beginning of all civilised existence first care of man was ever the improv of his home, and, in point of fact, all tions of interior or foreign policy cou traced back to this primitive instinct.

What did every citizen demand security for the peaceful enjoyment o home? It was to defend this that h willing to fight. It was to charm the that the poet sang and the musician p He did not speak of the painter and the tor who, in all great periods of art, ha laborated with the architect when not selves architects. There was no fi human activity up to the latest scientif covery which did not finally lead to the It was quite natural, therefore, that whose art thus stood at the beginn things should also be the architects forces of the spirit.

After expressing regret at the abse Mr. Paul Waterhouse, M. Godefroy s would like their British friends to tak with them a message to the President R.I.B.A. of cordial good wishes and for the continued assistance which the comed from the distinguished body over he presided.

In conclusion, after expressing tha Sir John Simpson and Sir Reginald Blo who were, he said, largely responsit their entente, M. Godefroy wished cor prosperity to the Union.

RCHITECTURE AND STAINED GLASS

: Charles Nicholson, M.A., F.R.I.B.A., ed recently on this subject to the British y of Glass Painters at the Art Workers' Hall. In the course of his remarks he the two arts of Gothic architecture and painting had had a more or less continuous y in this country during the last seven ries, neither of which entirely died out even g the eighteenth century, and both these ad been revived with more or less success g the nineteenth century. It was fashionable e present day to sneer at the achievements torian art; the nineteenth century was too to their own age for critics to be able e it in proper perspective; they had just ed at the stage where they had begun dmire Georgian art, and he had no that a succeeding generation would d the work accomplished during the eenth century with great veneration, pro- they did not destroy it all before it became nable to admire it again. Certainly, one admit that nineteenth-century art was erfully fertile and enterprising, and that rtists of the period were giants in their and that a century which produced build- ike Waterloo Bridge, the Houses of Parlia- Truro Cathedral, and All Saints' (Mar- street); paintings, such as those of Turner, re-Raphaelites, and Millais; sculptures Wellington's tomb, could not be passed as a dull period of artistic effort.

the beginning of the nineteenth century, the ey practised was by no means fashionable rishing, but it had never entirely died out, in this country or in France. Here, in nd, they had Wyatt, the fashionable archi- tinkering at their cathedrals, and glass rs like Eggington making enamel trans- cies to replace the rubbishy old thirteenth- y windows of Salisbury Cathedral, and to rtalise with bogus heraldry the imaginary tors of Beckford at Fonthill. The unfortu- Joshua Reynolds window at New College, e similar production designed by Benjamin at Windsor were then fresh from the glass rs' hands. And Peckitt, of York, was busy g windows in which it was by no means sible to trace in a debased form the tra- s of the later school of mediæval glass ng. Almost contemporary with Peckitt flourished a glazier at Shrewsbury, Henry Bettinson, who did several ws in Lichfield Cathedral and in St. s, Shrewsbury, which were quite tra- l in design and of quite excellent colouring. d never been able to discover whether this was an amateur or a practical glass painter, appeared to him that he managed to get good work done at a very difficult

arious parts of the country one met with of early nineteenth-century glass, a good f which was heraldic work done mostly mel, and a few replicas were produced Reynolds' "virtues" at New College. Early Victorian period, they met with rk of Willement Wailes, Warrington and the latter doing his work through Wailes rdman.

as in the 'forties and 'fifties that they to observe a serious attempt on the part ern glass painters to work upon consistent ctural lines, and they saw this very well n works as the windows of the Temple and an early church of Scott's, at West in Hampshire, both glazed throughout attern glazing and heraldry executed ate thirteenth-century work. Wailes' lass was interesting, the drawing of the was grotesquely mock-mediæval, and ecution was coarse and bad, but there metimes a good bold colour scheme and nally, when working under Pugin's n, Wailes produced some very good 's, as, for instance, in St. George's ral, better, he thought, than the Pugin rdman glass in the Houses of Parlia- ment. The best piece of Pugin and Hardman glass was, he thought, in Munster-square Church, where the whole of the glazing of the east end fitted in most happily with the architecture. A quite interesting artist of the early Victorian period was Warrington, who struck out a line of his own and worked upon late Renaissance lines, producing crude imitations of a certain type of coarse Flemish glass; but he had a good sense of colour and sufficient independence of mind to work upon lines which were not popular. Probably the most successful piece of glass of the early Victorian school was the east window of Ely Cathedral, by Wailes, the general effect of which was exceedingly good.

The artists most in favour in the later Victorian period were Clayton and Bell, O'Connor, Hardman and Gibbs; a little later than these came the present firm of Powell's, the pre-Raphaelite glass painters, Burne Jones and Morris; and, later still, the schools of Burlison and Grylls, and Kempe. All these were too near their own time to permit of their forming a just opinion of the merits of their work, but it was permissible to say that, in many cases, this was marked by a distinct recognition that it was the glass painter's duty to study the amenities of the building he had to decorate.

Perhaps the least successful in this respect were some of the pre-Raphaelite artists. Led astray by the pronouncements of an irresponsible doctrinaire and intoxicated with the flattery of highbrow critics, many of these artists, despite their great ability, had introduced glass into their churches which was not only entirely discordant with its surroundings, but which challenged attention in a manner quite destructive of the effect of repose which was essential to a fine building. One never found this agressiveness in old glass, even if it realistically portrayed the Day of Judgment or Jonah being vomited up by the whale.

It is a pity that such capable artists as the pre-Raphaelites were so immodest; the drawings of their cartoons were sometimes so beautiful, as in the St. Frideswide window at Oxford, and sometimes they produced work beyond all criticism, as in the east windows at Waltham Abbey. The failures of this school in places like Oxford Cathedral were a warning against self-confidence on the part of any artist who was entrusted with decoration which should be an integral part of the architecture. Liberties which might safely be allowed within the four corners of a picture frame became licentious when indulged in in the middle of a range of windows glazed in an unobtrusive if commonplace style. And here they came to the first and, he thought, the chief desideratum in glass architecturally considered—the great importance of consistency with other glass in the neighbourhood. Personally he would always prefer a series of commonplace windows to a miscellaneous collection of glass of different scales and different colour schemes. The good effect of uniformity, even where the glass was not of the best, was seen in churches like Tournai Cathedral and St. Denys, near Paris. The bad effect of the opposite system might be observed at Manchester and Llandaff Cathedrals. The former church had been glazed at various times, and some of the earlier work was not at all good, but later windows were, many of them, of quite excellent design and colour. These, in all cases except one, were designed to go with the early Victorian glass; the effect which had thus been attained was quite restful and good. One did not notice the defects of the earlier glass until one looked for them. Into this otherwise harmonious interior there had been interpolated a window representing the late General Gordon with fez and pocket testament complete, howling dervishes in the foreground, palm trees and an eastern sky behind, with results which were wholly disastrous to the architectural amenities of the church.

At Llandaff the cathedral was mostly glazed with pre-Raphaelite glass of the best type, cleanly drawn, well coloured, and thoroughly restrained and architectural. There had, however, been interpolated an "art nouveau" crucifixion window, coarsely drawn and heavily coloured.

The nave of Ely Cathedral was said to be a museum of the works of the best glass painters of the nineteenth century, and this statement provoked an impudent critic to ask a dignitary of that cathedral why he did not make his waistcoat into a museum of the works of the best button makers of the period.

It was a pleasure to turn from criticism to appreciation of what good and consistent glass could do for a church. Not to speak of places like Chartres or Bourges, or some of the Rouen churches, or King's College or Fairford, they could point to buildings like Bath Abbey, Pendlebury church, and St. Agnes, Kennington, all of which had been glazed throughout on a single comprehensive scheme, the result in each case being perfectly restful and satisfactory. Without quoting the works of living artists, Sir Charles said it was easy to recall a number of interiors which had been consistently glazed from end to end. Of course, some of them would prefer one man's work to another's, but he thought any architect and any glass painter would agree that the best results were only to be obtained where consistency of treatment was rigidly insisted upon. Personally he considered that diversity of treatment might sometimes be allowed within well-defined limits; for instance, a chancel might be glazed in a different style to the nave, but even so the better plan was to preserve unity throughout the building—not, of course, uniformity—but such unity as existed at Fairford, where the small subject windows in the chancel harmonised in colour and drawing with the single figures in the aisle windows, and these again with the picture windows at the west end.

It was hardly necessary to warn present-day artists against this inconsistency, but the glaziers of the middle of the last century often put a caricature of thirteenth-century glass into a Hanoverian window, and recently no less a person than the late Sir W. Richmond did something of the same sort in no less a place than St. Paul's Cathedral. However much one tried one could not well repress a sense of incongruity when one saw primitive decoration applied to ultra-civilised architecture.

The early fourteenth-century canopy glass had much the same disadvantage as the thirteenth-century work; it did not look really well except in a large building, but the glass of the late fourteenth century and subsequent periods down as late as the seventeenth century looked well almost anywhere, and, probably the most successful modern glass resembled this later work in general style. By the term "style" he did not refer to such matters as the details of canopies or costume, but to the general technique—that was to say, the proportion of white to coloured glass, the disposition and balance of colour, the amount of realism in the treatment, and the methods of obtaining effect by the use of pot metals, trace line, leadwork, painting, stain, etching, enamel.

A few observations upon glass technique from an architect's point of view might, continued Sir Charles, be of some interest. In the first place, it was generally by the simplest and most direct methods that the most satisfactory results were obtained. Thus, those effects which required heavy painting, an excessive use of stain, complicated tricks produced by etching, or the use of enamels, should be as a general rule avoided. Still, there were cases where these devices were permissible. There might be reasons in some churches and still more in civil buildings, for distinctly pictorial treatment of glass, pictures which appealed to people of rather unformed taste, just as some of the mediæval paintings and sculptures were devised for the edification of those who could not read books. Where it was desired to make a church's windows into a glorified picture book, care should in the first place be taken to select the subjects carefully, avoiding the trivial, the comic, and the abstruse. In the second place,

such realistic pictures should, he thought, always be framed either with architectural column and canopy work or with plain glazing of a thoroughly conventional type. If this precaution were observed the windows would look like a series of pictures and not a series of peepshows, and a very great deal of realism might be obtained without offence. Again, it was a mistake to be afraid of leadwork or saddle-bars or stanchions in a realistic window. These never interfered with the realistic effect; in fact, the typical Flemish glass of the sixteenth century without any concealment of its technical construction, conveyed a far more true impression of nature than an elaborate 1850 Nuremburg window with its leadwork suppressed and with its many tricks of painting and enamels.

The secret of the whole matter seemed to be that the glass painter must never lose sight of the cardinal fact that his art should be essentially a decoration. He was bound to go wrong if he regarded the window as a hole in the wall through which one looked at some scene, however sacred and edifying that scene might be.

With regard to all modern glass, he felt that there should be no necessity to confine oneself to archaic draughtsmanship. There was nothing particularly convincing either in the stumpy figures drawn by the modern mediævalist or in the lachadaisical personage portrayed by the pre-Raphaelite school. On the other hand, there was no advantage in departing from tradition in such matters as costume or emblematic accessories; they possessed a generally understood tradition in these matters and it was mere wilfulness and conceit to discard it. Neither, in their anxiety to avoid archaism, were they justified in portraying the saints as wild fakirs or robust pugilists; the drawing should rather be as correct as possible, and also as simple and straightforward as possible. Drapery and other accessories should be carefully drawn and formally arranged; the effect aimed at should be intelligible, quiet and decorative, neither grotesque nor dramatic.

As for the detail, it should always be carefully drawn and any slapdash treatment should be avoided—at any rate in windows at all near the eye. But it was by no means always desirable to cover a window with elaborate ornament, very often an absolutely simple treatment like that of the Jesse window at Dorchester was the best, especially in a small or simple building. A great deal of modern glass was overburdened with detail and the effect of this was merely tiresome. It was far more satisfactory to discover fresh beauties in a leisurely examination of glass than to be struck at first sight with the profusion of the decoration, and afterwards to discover with Solomon that all was but vanity.

As regards colour arrangement, too, the modern glass painter was sometimes apt to err in over-profusion. Over and over again one saw windows containing all the colours of the rainbow and more. The old glass painters were far more restrained, whether by choice or not, he could not say.

He did not know how far the architect of a building should control the character of the glass. Theoretically, of course, the architect should control everything, but it was not always the case that he had sufficient knowledge of the technique of all the crafts employed in a building to make close personal supervision practicable; on the other hand, he thought the architect should always be consulted in the selection of a glass painter, as whatever be the said architect's deficiencies, he was at least able to judge what kind of work would best suit his building.

Finally, if he had wandered a little from his point and said too much about glass in general and too little about glass in relation to architecture, Sir Charles said his excuse would be that one could not lay down a hard-and-fast rule and say that only one particular style of glass must be used, to the exclusion of other styles. It was not even necessary that the glass in a building should be of corresponding style to the architecture. The only definite rules there could be laid down were that the glass should be consistent with itself, that it should be good of its kind, and that it should have those qualities of colour and translucency which accorded best with the architectural disposition of the building.

RENAISSANCE TOWN PLANNING

MR. WILLIAM HAYWOOD, F.R.I.B.A., in his third lecture on town planning at Birmingham University, said the renaissance of classical literature in the first years of the fifteenth century A.D. coincided with a loosening of feudal and Church control. New ideas were formed; old ideals were studied and imitated.

Literary reference to the structure of Ancient Rome led to archæological research, chiefly for the practical purpose of assisting fifteenth century architectural ambitions, which in Florence had advanced beyond the technical ability of the times. Brunelleschi (1377-1446) made first use of this new interest in Old Rome, and studied ancient vaults and domes in order to complete the cathedral of Florence.

The new social order expressed itself in great secular buildings, of which the Riccardi Palace (1430) and the Pitti Palace (1440) are early examples. Important buildings were planned in axial relation to their environment; in towns, as a climax to neighbouring streets or squares; in the country, associated with formal garden effects of a scale and character clearly prophetic of a new order in town planning.

Rome followed Florence in the new progress. Pope Sixtus V (1585-89) restored the water supply, and so made large areas of the upper town habitable which had laid waste since the destruction of the aqueducts. His architect Fontana planned new roads for the development of the abandoned areas; and his arrangement of the Piazza del Popolo was notable as the first example in history of a public place at the entrance to a city, so associated with diagonal routes as to facilitate the direction of traffic to and from widely separated sections of the town. This Piazza was essentially a traffic centre; and as such initiated a new use for public squares; which from this time onwards became less exclusive in character, until they lost all sense of enclosure, and became mere road widenings for the convenience of traffic distribution.

Fontana's planning for Rome in 1585 preceded Wren's plan for the rebuilding of London by 81 years, but although Fontana introduced a new factor into road design, and also conceived his roads and public buildings as parts of the same composition, yet his projects were never welded together as one scheme; and it was reserved for Sir Christopher Wren, with his design for the rebuilding of London in 1666, to conceive the first town plan of modern character, in which all sections were suitably co-ordinated.

Wren took no hint from Paris, for at this time Paris had taken no step forward in town planning; her present eminence in this respect being due to a long process of sectional improvement, with Haussmann's linking-up devices of the mid-nineteenth century to give cohesion to the whole. It was the more remarkable, therefore, that Wren should have so anticipated present practice, that his plan stands equal with the best town planning of to-day.

EXHIBITION NOTES

THE ROYAL WATER-COLOUR SOCIETY.

NONE who appreciate water colour art can fail to look with pleasurable thought at the exhibitions of the old Water-Colour Society. If there is nothing highly stimulating or fresh, we can always count on some who pursue the art with an outlook that is placid in expression and soundly concerned about composition and colour. Yet half-a-dozen drawings by Harry Rushbury have been welcomed on these walls, though atmosphere, composition, and graphic detail seem to provide all one needs in drawings which are almost sepia monochromes. The "S. Sauveur, La Rochelle," is one of the most delightful drawings of its kind we have seen. A fine sense of atmosphere and di conveyed in the drawing of "La Toque by the President, Sir H. Hughes Stant it has no strong colour value like t sketch of the Ferry, with its jewel-lik by Miss Alice Swan (54), or the dainty at Dawn," by R. Anning Bell (98). T many pleasant subjects, and there is amount of technical skill in the exhibit it is astonishing how little there is whic one's attention from a fine or telling colour. Such drawings as (171), (170) a do appeal to one for definite colour val note a fairly good show of sales for so the exhibition.

YORK AND EAST YO SHIRE ARCHITECTU SOCIETY

THE members of the York and East Y Architectural Society visited Kingsto Hull recently. The visitors assembled Royal Station Hotel at 2 p.m., where th welcomed and entertained by the Vice-P of the Society, Major J. M. Dosser, F.R Among those present were Messrs. H. J. Ferguson, F. J. Horth, Dudley H Llewllyn Kitchen, E. A. Pollard (Hon. Tre York Society), J. E. Reid (Hon. Secretary Society), T. Snowden, W. S. Walker, Watson, W. B. Wheatley.

The party proceeded to view the new G and Town Hall, which was designed by Russell and Cooper. After a tour extensive building—the council chamb the Lowgate elevation of the town hal particularly admired—the members received in the Mayor's parlour by the Hon. the Lord Mayor (Councillor E. E. Kei the Town Clerk (Mr. H. A. Learoyd), and

The Lord Mayor expressed his pleasu pride in the fine building which housed t poration. He indicated briefly the vas mercial importance of the city, expressi opinion that it would grow and extend future with greater strides even than it ha in the past.

On behalf of the Society, Major J. M. and Mr. J. E. Reid expressed the apprecia those present, and expressed the regret President (Mr. Stephen Wilkinson) inability to be present.

The Parish Church of Holy Trinity wa visited, where the history of the fabric account of its restoration were given W. S. Walker, York Diocesan Surveyor. tect for the restoration.

The members then proceeded to the House, originally instituted as a guild in of the Holy Trinity in the time of Edwa now incorporated for charitable and m purposes. The buildings are very ext and of great interest, the front to House-lane being a beautiful reserved c composition in the Tuscan manner, of st stucco, built in 1753, the carved worl executed by Jeremiah Hargrove. The cha built from designs by Sir William Cha the Court or Banqueting room decora Robert Adam; and the council c instead of being carpeted, has for it covering rushes thickly strewn—a custo has never been departed from in the Guil history.

The tour was concluded by a call at force House—the house in which Sir John entertained King Charles on his visit to 1639, and in which the city's most emin William Wilberforce, was born on Aug 1759. The house is now used as a muse taining the impedimenta of the emanci the slaves. The elevation to High-str fine example of brickwork, whilst the int its several parts is a well-preserved and c series of rooms, illustrating by their porary remains of fireplace, wall-treatme ceiling decoration, the successive phases tectural development of the English ho

D WESTMINSTER

RE on "Old Westminster and its Buildings, Past and Present," illus- h a large number of lantern slides, by Mr. Herbert A. Cox, F.C.A., to ts of the Department of Architecture, and Building, at the Northern Poly- stitute recently. *The Builder* model Westminster was exhibited, and the uded drawings by Hollar and the . Brewer, and many old views of the l its buildings.

ibing a drawing by Brewer of the n the east (the drawing from which er model was made), the lecturer y VIII was responsible for part of in the cloisters and oratory of the In the centre was the magnificent St. Stephen's. The Court of Re- ilt by William the Conqueror, was hall of his palace. The palace m the south, where was the resi- rtion. Edward the Confessor was he first monarch to settle down and nome in Westminster, and it was he or rebuilt, the Abbey, the great ster. in 1065. William the Con- pted the palace, and was crowned in . His successor, William II, built er Hall in 1097. Just 300 years it was rebuilt by Richard II, who walls a few feet higher and entirely ed the roof. In referring to a slide Hollar's view of New Palace-yard in lecturer said the north entrance of er Hall was very much as seen the coffee-stalls and shops that later nded it had been cleared away. In of the Yard was a conduit which on s ran with wine. The Yard was a place for the people. It was a blind it did not lead anywhere except to Henry VIII gave up the palace as residence and moved to Whitehall, Elizabeth still fancied some portion ace and used to reside there.

Drawing of the Painted Chamber was as more interesting than it looked, one of the most ancient of the Par- buildings. Tradition said that e Confessor built it and died there. e main feature of the Palace in he Conqueror's day, although he Hall called the Court of Requests, larger than the Painted Chamber. beautified this Chamber, the wall of which dated from 1237; they re- the battles of the Maccabees, and g the earliest specimens of purely . Its glory as a chapel hen it became a Parliament House. n was credited with having founded . dedicated to St. Stephen, but ought it was really the work of It was destroyed by fire in 1298. d I commenced a new St. Stephen's d. Edward III completed, so it was entury work. From a view of the the west side it was seen that there and that the upper floor was con- ove the ground. The entrance was to the south end of Westminster chapel had five bays, so it was big building, and when it came to by the Commons it gave a very ber indeed.

the pictures on the walls were re- of surviving originals in the British he whole chapel was covered with statuettes of kings. One of the kable things about the chapel was ere preserved in written form the nts of the building and the decora- tion of it, and these were the most interesting of their kind in existence. Everything, including the costly pictures painted on the walls, was paid for by day wages, except some of the statues; the names of the master masons and the masons and the stained-glass makers, and even the workmen, were recorded. When Sir Christopher Wren altered this Chapel he found some of the paintings and covered them up, but in the year 1790, when the House of Commons had to be made larger to admit the members representing Ireland, some of these paintings came to light. As a place of worship the chapel had a sanctuary within it; there was a great stone screen and an altar on each side of the entrance, while within were stalls facing one another.

At the conclusion of the lecture a hearty vote of thanks was accorded to the lecturer.

SOCIETY OF ARCHITECTS

Mr. Alfred John Taylor, the new President of the Society of Architects, was born at Bath in 1878. In 1902, after having been successfully pupil and assistant to the late Charles E. Davis, F.S.A., the City Architect, he set up in practice on his own account. During that time he assisted Major Davis in a comprehensive scheme of excavation, undertaken on behalf of the Corporation of Bath, to lay bare the Roman

Mr. Alfred John Taylor.

thermæ in that town. Since the death of Major Davis he has been entrusted by the Corporation with the care of the present remains. Recently he has uncovered further portions of the thermæ, hitherto unknown.

In addition to his antiquarian work Mr. Taylor has an architectural practice which is not confined to his native city. He is architect to the Baths Committee of the City of Bath, and has made the planning of hydropathic establishments a speciality, making numerous visits to most of the Continental spas. He is also responsible for the medical and swimming baths at Torquay and Leamington Spa, and is at present engaged on similar works at Malvern. Connected with this branch of his practice is the great number of hospitals which Mr. Taylor has designed, such as the series of buildings for the Forbes Fraser Hospital at Weston, Bath, recently opened by the Duke of Connaught. At the moment he is engaged on similar buildings in Wiltshire. Mr. Taylor is also the author of a number of industrial buildings, city halls, concert pavilions, cinemas, restaurants, hotels, &c., besides examples of domestic work in Somerset and the surrounding counties, and also in South Wales.

In addition to this he has been engaged in the planning of racecourses with their adjacent buildings, and among the works of this kind executed by him, those at Newbury, Bath, Salisbury, Bournemouth, and the projected scheme at Chepstow are the most important.

ARCHITECTURE AND CIVIC FORCES

Sir Banister Fletcher recently delivered a lecture at the Central School of Arts and Crafts on the Architecture of Central and Northern Italy in the Romanesque period. He said that the wonderful reawakening of mediæval civic life in Italy made it possible for little cities like Pisa to undertake grand works of architecture good and beautiful enough to go down to posterity. The architecture of Pisa drew like a magnet people from all parts of the world, and reflected through all the ages the varied enterprise of her citizens in that building art which touched human life at all points and involved questions of land and housing, of town planning and public works. Then, the craftsman had his recognised work and place in the scale of civic life. The world-famed Leaning Tower, the Cathedral, and the richly-adorned Baptistery constituted one of the best-known examples of collective planning of important buildings in the past. This group held a place in Italian fame like the Acropolis, Athens, in Greece, and the Roman Forum, and a rising spirit of civic independence, coupled with religious idealism, prompted this trio of splendid monuments, and the bells still rang out from the bell-tower or campanile to call the faithful to worship as they had done for centuries.

The next lecture will continue the study of Italian Mediæval Architecture.

DOMESTIC ARCHITECTURE IN ENGLAND

At a recent meeting of the Anglo-Swedish Society, held at the Swedish Hall, Harcourt-street, Marylebone, and attended by the Crown Prince and Crown Princess of Sweden, Sir Lawrence Weaver lectured on "Modern Domestic Architecture in England." In the course of his remarks he said, in his opinion, Sir Edwin Lutyens combined in his work the skill in design characteristic of the Norman-Shaw School and the right choice of materials which characterised the Philip Webb School. He was very proud of their domestic architecture, which had developed from many centuries of peace and wealth, influenced by such things as their garden backgrounds, which had no equal in any country in the world. They had drawn the materials for modern design from a rich mine, and as an imperial race had brought back ideas from all parts of the world. To-day they wanted what they could never get nationally in domestic architecture, but might have locally—a tradition. Their enormous variety of local traditions was due largely to the enormous variety of materials in English soil, giving them the delightful, vernacular character of their country buildings, which seemed to have grown out of the soil. Sir Edwin Lutyens was undoubtedly the great living master of English architecture. He had gone through the whole of its development in his own lifetime, and had done it all extremely well. He had arrived now at a sober, well-designed type of house, and as soon as people began to copy his old mannerisms he invariably invented new ones. He had given a new direction to garden design, and his art owed much to him and to Miss Jekyll for marrying together good architecture and good planting. Sir Lawrence further observed that one of the worst influences in modern architecture was the tendency to make exact copies. The worship of old styles was very offensive to the modern architect, and they were hypnotised too much by the idea of replicas of past work.

Royal Institute of British Architects.

The inaugural meeting, which will be opened by the President's Address, will be held at 9, Conduit-street, W.1, at 8.30 p.m. on Monday, November 3. The Medal for the year 1923, which was awarded to Mr. Frank T. Verity, F.R.I.B.A., for the Shepherd's Bush Pavilion, will be presented to Mr. Verity.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Soft Water.

[REPLY TO MR. J. A. GRICE, OCTOBER 24.]

SIR,—Many authorities recommend that a heating system should be filled up in the first instance with soft water in order to obviate the corrosion of pipes and the furring up of same, and this is in itself a reassurance upon the point raised by your correspondent. The pipes should, of course, be galvanised.

With regard to the cold supply, the effect of this upon various materials of piping in different districts varies in accordance with the composition of the water. The best information can be obtained from the local water authority, and in some districts the use of copper piping is now insisted upon.

"PLUMBING."

Cinder Tracks.

SIR,—I should be glad of any information that can be given me as to the laying of cinder running tracks, both as to the method of laying and the composition of the materials.

"SPRINT."

Communal Laundries.

SIR,—If any of your readers have had experience of the above I should be very grateful for any information that can be given. Are they popular with the tenants of housing schemes, and is it the general experience that they can be organised to run smoothly without friction among the tenants?

"SUDS."

Filter Beds.

SIR,—What is the best material with which to fill the filter beds of a small septic tank sewage disposal system? I have found coke breeze get foul very quickly and need continual renewal.

"SANITAS."

Rendering Accounts.

[REPLY TO "ARCHITECT," OCTOBER 17.]

SIR,—We have read with interest the letters that have appeared in your paper on this matter, but have been particularly interested in the remarks of "Architect" on the subject of establishment charges. He concludes by saying that a calculation of establishment charges on a percentage basis would be a useful index of the efficiency of a business.

We venture to suggest that some useful purpose would be served if "Architect," or some of your readers (writing anonymously) would state the usual percentage in this connection. It must, of course, differ to some degree from business to business, as the class of work performed and other circumstances necessarily cause fluctuations in the percentage. We should be very interested to know, comparing like with like, what percentage is an index of efficiency and what percentage of inefficiency. Confusion would be avoided if a statement of precisely what is included in establishment charges were afforded.

GARSUBIL, LTD.

Plastering.

SIR,—Can any of your readers inform me as to the nature of material used for plastering the walls of squash racquet courts?

J. C. HOUSTON,
Division Officer, R.E.

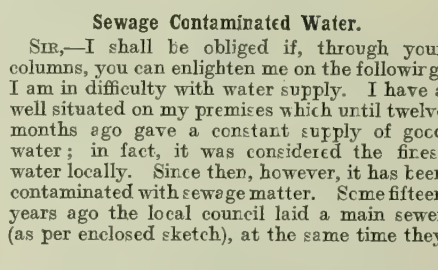
Traction Drive.

[REPLY TO "BERKS." OCTOBER 24].

SIR,—It is well to allow at least 40 ft. for turning space for large cars, but a carriage and pair can turn practically in its own length, and 18 ft.-20 ft. will be found to be ample for the purpose.

"QUADRANT."

SIR,—In response to the enquiry by "Berks" in last week's issue of *The Builder*.



An open carriage and pair is about 18 ft. long by about 5 ft. wide, and requires a circle of from 22 ft. to 24 ft. diameter, in which to turn. Probably the same dimensions would suit a motor car as well.

Clapham.

ELFRIC H. SMITH.

Sewage Contaminated Water.

SIR,—I shall be obliged if, through your columns, you can enlighten me on the following. I am in difficulty with water supply. I have a well situated on my premises which until twelve months ago gave a constant supply of good water; in fact, it was considered the finest water locally. Since then, however, it has been contaminated with sewage matter. Some fifteen years ago the local council laid a main sewer (as per enclosed sketch), at the same time they

laid my branch drain, which is also shown, the cost of which was, of course, borne by the owner of that time. On unearthing this branch I found that thick black sewage matter oozed from almost every joint, which had never been properly made with cement. I had these enclosed with cement concrete, the well emptied and scoured; this has now been done three times in the last twelve months. After this I had the water analysed a third time, with the result that it showed no improvement, and is still quite unfit for drinking purposes. It contains a certain sewage matter for which, I am certain, my drain has never been used. There appears, therefore, only one way by which this matter could possibly contaminate the water. I believe there is a leakage in the main sewage and the fluid follows along the outside of my drain, which is practically dead level, and from thence to the well. I have already paid almost £20 in connection with this nuisance, and the cost of a new well is in the neighbourhood of £30. Can I claim any compensation from the council, the owners of the main drain? The sewage matter concerned is chiefly urine. I think the enclosed sketch will simplify matters.

I have marked my suggested reason, which I think quite feasible.

"YOUNG BUILDER."

"Eavesdropping."

SIR,—In regard to the point raised by "Bookworm" as to the origin of Eavesdropping, the quotation below is from Dr. Brewer's "Dictionary of Phrase and Fable":—

"Eavesdropper—One who listens stealthily to conversation. The derivation of the terms is not usually understood. The owners of private estates in Saxon times were not allowed to cultivate to the extremity of their possessions, but were obliged to leave a space This space was called the "yfes-dry drip). An eavesdropper is one himself in the eaves-drip to overh said in the adjacent house or field."

"Under our tents I'll play the eav
To hear if any mean to shrink
Shakespeare, "Richard

I have come across instances of na between buildings which are locall "ladder-ways." This looks like a the "eaves-drip."

Cromer. ERNEST EDWAR

Floor Coverings.

THE BUILDING TRADE

"THE WASTE OF CAPITALISM"

this title a Report of the Committee y into Production which was set up by ional Joint Council representing the Union Congress General Council, the Party Executive Committee, and the ntary Labour Party has been published let form with a foreword by Mr. A. A. Mr. Purcell, in this foreword, so reads rt: "The results are presented in the pages in a form which cannot fail to every reader with the fundamental nd the deficiencies of the capitalist of production. There is abundant in this volume to prove that responsi- the failure to reach maximum output n the employers."

nnot agree with Mr. Purcell in either statements; we may say that the an extremely interesting compilation n statistics, but it is a well-recognised different conclusions may be drawn by minds from the same set of statistics. ," using the word generally, is con- iat nationalisation or Socialism is the ll evils, and they draw that conclusion se statistics—we will not say fit the to support their theory. Other people, dmitting that our present system is by s perfect and has defects, do not draw stic conclusions from the defects, and in the latter view it has to be remembered perience is a support to the present whereas the advocates of Socialism oint to a single state where such a system been practised with success.

ery long ago the Labour party would nted to the little State of Georgia as a favourable example of a Socialist t now they are proposing to subsidise nist state that is over-running Georgia as they say to obtain trade for this from the former.

rcell says that the result of this inquiry ow the onus upon the employers of hat the "trouble lies with the workers," may be the case in respect to certain nd defined defects, but he goes much an this and speaks of the report in effect ictment of the whole capitalist system, we contend the onus lies on those who change a well-established and tried nd the present volume contains nothing the nation to take a leap in the dark. eword he states that this inquiry is to d further, and in a later volume the e will state their views as to the to be applied, and were this further ailable it would be easier to discuss the raised in this present volume, for at is only conjecture that the remedies will be nationalisation. As it is we confine our observations to certain ised in the present report.

ms of reference were: "(1) To consider es are impeding maximum production ies and services from the standpoint of sts of the community and what im- ts in organisation and direction can ted; and (2) to advise the National ncil on a labour policy for those to which nationalisation could not for t be applied, such a policy to have the efficiency of the industries, to the l welfare of the producer, and the ests of the consumers." The Com- pear to have stopped short halfway first paragraph and to have limited iry to the causes impeding production, from any suggestion as to improve- organisation and direction. The indictment is (1) that productive efficiency in British industry is considerably lower than it might and ought to be; (2) that the responsibility for this inefficiency must be borne by the present system of industrial organisation and by employers individually and collectively; (3) that the principal sources of waste and inefficiency are (*a*) workers' lack of status, responsibility, and control; (*b*) absence of incentive to work for profit-making industry; (*c*) insecurity of workers and periods of unemployment; (*d*) effects of the trade cycle; (*e*) inadequate, defective, out-of-date machinery, plant and equipment, defective lay-out of works, &c.; (*f*) lack of co-ordination between industries and parts of industries; (*g*) defective organisation of works; (*h*) defects in the transport system; (*i*) deliberate restriction of output to maintain prices; (*j*) long hours and unhealthy conditions of work.

We regret our space will not permit us to discuss this indictment in detail, and we must confine ourselves merely to noticing one or two points. Now, in dealing with statistics, it is always important to see the point of view with which they are quoted, and in the first place we find that the committee assert that when employers ask for "maximum production" they do not mean production to satisfy the desires of everyone at a price within the means of everyone, but their main interest is to make profits, and as to increase production does not necessarily mean to increase profits, therefore what they really desire is not "maximum production" but lowest possible labour costs or the maximum production per employee. Then follows this very illuminating pronouncement, "For the sake of clearness it has been agreed that, from the labour point of view, 'maximum production' is that which is reached at prices which cover the minimum cost of production by the most economical methods consistent with the maintenance of a proper and progressive standard of life for the producers." But this is elaborated at page 16, where four classifications of output are given (1) that we have just quoted; (2) output at a level at which the price obtained by each producer just covers his particular costs of production; (3) output at a level at which the price obtained covers each producer's costs and yields him a fair remuneration in profit for his services; and (4) output at a level at which the price obtained covers all costs and yields an unreasonable or unfair profit to the producer. The report then states that (1) represents the definition of the committee of ideal maximum production which, under a different system of industry, would be obtained, whilst the present system compels the normal restriction of output to at least the level of (3). If the case against employers for restriction of output is based on these classifications, they have not much weight in them. No. 1 is the labour ideal apparently; production per employee is not to be regarded in the first place, and, secondly, no profit is allowed at all, but only "a proper and progressive standard of living for the worker." This, surely, is depriving the "worker" of initiative, and if there are no profits at all, how is the future State to be maintained? The contention is that output would be increased, but industry is deprived of incentive and no provision is made for that milch cow of the Socialist—the State. Profits are taxed and provide revenue for the State, but this statement considers the standard of living for the worker, but omits the State by which apparently he is to be maintained in a state of semi-lethargy in comfort. With regard to restriction on output by combines, the report states it is practically impossible to obtain evidence. We are not in favour of large combines, either of employers or employees, as they destroy personal relations, but it is important to observe that, even in combines, the committee has no affirmative evidence for the conclusion it draws.

Our space only permits us to glance at one other subject—the method employed by the committee in its reference to strikes and lock-outs. In the first place, the report fails to grasp the serious indirect consequences of trade disputes.

The report states, "There is the direct loss measured by the loss of working days during which the disputes have lasted; and there is a further loss as yet undetermined in magnitude, owing to the fact that after a stoppage the former level of output is not reached until the lapse of a certain time after work has been resumed," and then the committee refer to the psychological atmosphere after disputes, saying, if the workers have been successful, there is a probability of increase of output for a time, whereas defeat has an opposite effect. The loss of market, the flight of trade abroad, the deterioration of works and plant, are all ignored, and the worker is alone considered; and, finally, as an apologia, the loss of time from trade disputes is compared with the loss of time from unemployment. Unemployment is put down entirely to the present industrial system and as causing a loss of time far exceeding that lost in trade disputes. The two elements—trade disputes and unemployment—are not comparable at all, and we are surprised trade unionists should compare the inactivity of the most highly skilled and capable men in the country whose services are in demand with the lack of employment of the whole body of insured persons unemployed, who must include in their numbers a vast number of varying ability.

There are tables in the report which elaborate this theme. The working population is taken as 12,000,000, and in the record year 1921 the loss of time owing to disputes is shown to be 7.15 days per head of this population; or, on an average taken over a number of years, 2.11 working days. The number of insured persons unemployed are also averaged, and the number of days they might work is computed, and the two results are compared. Is it necessary to say more than to explain the method adopted in this chapter? The "employable" of the highest capacity are compared with the unemployed, their capacity for output is placed on the same level and, apparently, under the new State, they are all to be paid alike out of funds provided by no one at a progressive standard of living. The high standard of trade union wages is standing in the way of those of low ability being employed. These figures, however, do serve a useful purpose. Take the record year in which employed persons stood idle through disputes for 7.15 days a head, the number being as stated 12 millions, and take those wages at the ridiculously low average of 30s. per head, and the direct money loss in wages alone would be over £18,000,000, which would have been a welcome contribution to the unemployed, but which, with countless other sums, was lost to the nation altogether by lack of conciliatory measures in industrial matters. We notice that the word "conciliation" does not even occur in the index to this interesting volume.

Waste of Capitalism." Foreword by A. A. , (Chairman of the Trade Union Congress). Labour Joint Publications Department. .)

Portsmouth War Memorial.

Mr. Samuel Salter, Southsea, was the contractor for the foundations of this memorial. They support a total weight of approximately 1,100 tons. The area covered by the base measures 55 ft. square, into which have been driven 73 reinforced concrete piles. These piles, which weigh about 30 cwts. each, are each a foot square, 20 ft. in length, and pointed with hardened steel.

Sir Robert Lorimer, A.R.A., was the architect and Mr. Henry Poole, A.R.A., the sculptor.

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., Assoc. Surveyors' Institution, F.R.San.Inst. (Barrister-at-Law).

XVI.—LIABILITY FOR DAMAGE TO PERSONS, PROPERTY, OR THINGS, ETC.

THE contractor, or the owner, or in some cases the architect, or any two, or all three of them, may be liable for damage, or injury, to any person, or to adjoining property, or to things, or animals, by reason of the carrying out of any building contract. Sometimes, however, they may all be exonerated if the damage, or nuisance, is an unavoidable result of the conscientious exercise of their legal rights, and where there is no wantonness.

Indemnity Clause.

Most contracts now contain a clause, whereby the contractor indemnifies the owner from all liability for damage or injury resulting from negligence on the part of the contractor, or his workmen, or agents, in executing the work. This clause is not an attempt on the part of the employer to contract out of his liabilities, for it does not include damage caused by the nature of the work, for which, in general, he is liable. The clause only covers that caused by the methods of execution, or other means, adopted by and under the control or management of the contractor, or where he does not follow instructions given. Where the work is such as can lawfully be done, and without injury to others, and the employer has given over the control of the work, and there is no negligence on his part, then, in general, the contractor is solely responsible for any injuries to others, due to the works, or caused by the negligence of his workmen.

The employer must, however, take all precautions where injury may be expected to arise from carrying on lawful works. His responsibilities are much greater when he has employed a contractor to do anything that is unlawful in the work.

Contractor's Liability.

The contractor is liable under the terms of the indemnity clause, and any sub-contractor is liable to him similarly, if the work is a lawful undertaking.

If a workman let fall a brick from a scaffold, and the building owner is sued for the damage or injury caused to any person below, the contractor is liable; and the owner may seek indemnity from him in respect of what he is ordered to pay (see Pearson *v.* Cox (1887), 2 C.P.D. 369).

If an employer lends men to a contractor, or a contractor to a sub-contractor, the person under whose direct control any workman causing damage was, at the instant of his default, is liable. So, if a person accepts the loan of a workman of another, and does not pay any consideration for the loan of him, he is liable for damage, because the employer of the workman has *pro. tem.* handed over his control (see Donovan *v.* Laing Construction Syndicate (1893), 1 Q.B. 629, and Perkins *v.* Stead (1907), 23 T.L.R. 433).

Employer's Liability.

If the employer retains any control over the work, or if it is shown he has interfered materially with the contractor's control, then he will become liable for his own negligence and that of the contractor, sub-contractor and all workmen, losing his rights under the indemnity clause (see Bennett *v.* Castle (1898), 14 T.L.R. 288).

Employer and Contractor may Both be Liable.

In some cases the employer and contractor are both liable, jointly and severally, and where this is so, and the aggrieved party sues one of them only, and obtains damages, he has no "right of contribution" against the other. Also, if the aggrieved has already sued one of them, he cannot sue the other separately (see Merryweather *v.* Nixon (1799), 8 T.R. 186).

Implied Contract of Indemnity.

It would appear that where damage is traced to some default of the architect, and he becomes, therefore, a joint tort-feasor with the employer, if the architect can prove that he acted as the agent only of the employer, and without any knowledge or foresight of possible damage, he (the architect) could claim an implied contract of indemnity (see Sheffield Corporation *v.* Barclay (1905), A.C. 392).

Where Neither Contractor nor Employer is Liable.

If damage results from the exercise of the legitimate rights of the employer, the aggrieved has no remedy.

A person may erect a wall at the extreme boundary of his property; he has, however, no remedy against the owner of the adjoining land, if the latter makes excavations within his rights, which cause the wall to fall down; unless he has acquired the right of support for his wall, by express or implied grant, or by prescription. He has only the right to the support of his soil, not, therefore, the building thereon (see Dalton *v.* Angus (1887), 6 A.C. 740).

The aggrieved has no remedy where the damage results from the act of God or *vis major*, or where he is a sufferer only in common with the general public. If, however, he can prove any special suffering on his own part over and above that of the public, he may take action. For instance, if a contractor by any obstruction of the highway prevents access to neighbouring premises and causes loss to the occupier, the occupier may sue independently in respect of his particular suffering.

SATELLITE TOWNS

SIR THEODORE CHAMBERS, Fellow of the Surveyors' Institution, and Chairman of the Welwyn Garden City, lectured to the London Society on this subject some time back. Sir W. Joynson-Hicks, Minister of Health, presided.

The Chairman said the question of satellite towns appealed to him from two points of view, both of which related to the positions and conditions of great cities to-day. First, there was the question of transportation, and even of locomotion, in great cities, which had become a grave problem. It was only necessary to look at the conditions of the London streets to realise that something would have to be done to relieve them before many years were passed, for those conditions made it almost impossible for men and women to get to their work in reasonable comfort. Again, there was the question of public health. From that point of view he was convinced that there was no cause more detrimental to the health of the people than overcrowding or slum conditions. Disease, vice, and misery were all aggravated, if not actually promoted, by slum conditions in their great cities.

Part of his duty consisted in trying to get rid of all the conditions which made for evil in the life of the community. The slums formed one of those conditions. He had in mind a London slum where 1,600 people lived. It had been scheduled as a slum area and arrangements had been made to get rid of it. But it could not be got rid of until means were provided for rehousing the people who were turned out. If the area were cleared without first providing some place for the dwellers to go to, the only effect would be to increase the congestion of the surrounding streets. He thought the congestion had its limit and more than its limit, and to the satellite town as the real soluti difficulty.

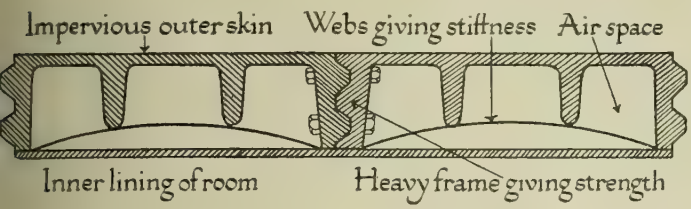
He had made many speeches on the necessity of spreading the populatio country. The people must be got o existing enormous cities. It was not merely to get them into adjoining because the expansion of the subu added, after a very little time, to the c of the city. What was wanted was towns, complete new entities planted c country districts where people would to live far better, far happier, and far lives than they could possible live to-d existing conditions in the cities.

Sir T. Chambers, in the cours remarks, said the garden city m arose as a protest against the ove and congested condition of many old cities. The garden city must not be with the garden suburb, nor with town as such. The garden city was an ind town with its own industry, its own its own town centre and industrial dential areas carefully planned a connected with roads.

Town planning was a science which applied to old towns as well as n Garden suburbs were well planned residential areas, and acted as dorm the city to which they were adjacent s ubmitted that the new town built o area in a suitable place and under conditions could expeditiously provid expansion of population and industry also submitted that an existing overg overcrowded and congested city c provide for its own expansion by the of the garden city policy, encoura development of garden cities at a co distance from its periphery, to wh industries, which need not be centre city, should be encouraged to move.

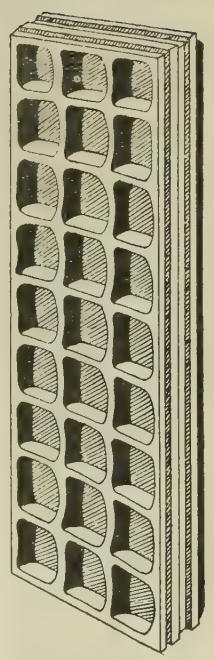
It was submitted that the adoptio policy would enable improvements in t city itself to be more easily and exp carried out. When the pressure of p was taken out of the parent city by the the polity of slum clearances, the pr open spaces, and parks, and the wi thoroughfares would be made easier. these things could not be carried ou owing to high land values and he pensations which became payable.

The policy was peculiarly appl London. The congestion of popu London was very great. Within 4 miles there was a population of 6¾ 30 persons to the acre. The traffic London was, he thought, insoluble. and motor traction had given Londo extended lease of life which was nearl It was submitted that the only pos if the population were further incre would be inevitably, was to adopt of satellite towns, to which many which need not be situated in Lond be encouraged to migrate. Within Counties the rural areas with an a 4,000 square miles, had a populati .3 per acre. Within this territory were available and suitable for sate The policy would not be as detrime countryside as the indiscriminate development of which they now The concentration of developmen areas under well considered sche leave the intervening country u That the policy was financially prac shown by the success of Letchworth a Gardens Cities—both of which had experimental stage. The policy of p factories in new towns was being adopted by manufacturers in the U They would not erect new factories congested towns. It was probabl policy would be followed in this c it was submitted it would not be d city like London to encourage with exodus of many factories to satell the Home Counties.



EW INVENTION

Burney" Unit System of House Construction.



informed that it is proposed to erect Crayford six experimental houses system put forward by Commander t is also proposed, during the course few months, to equip a factory for e of their manufacture. The details em, taken from material supplied us, ws :—

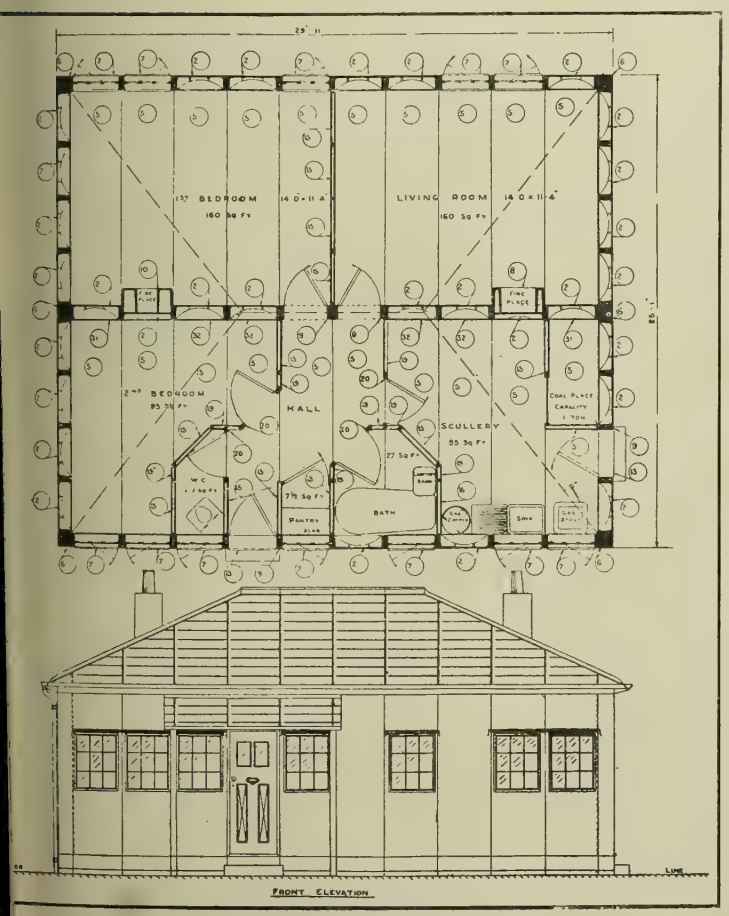
rete," the new material of which the " house is constructed, is manufac- a certain waste product which is first emically, turning it into a hornlike called " parakerasite," and after- orporated with cement under great While of somewhat greater strength, impervious quality is used approximating more nearly in its properties to stone. For the floors, walls, and ceilings, use is made of a somewhat softer, more resilient variety, with a warm surface resembling that of wood. It is readily produced in many different colours and shades.

The " Prefacto " house is built up of individual units, moulded under pressure at a central factory, transported to the site, and there erected in position. One unit forms a standard wall section, a second contains a window, a third a door, another is a floor section, and so on. The system has been so developed by standardising dimensions that by varying the relative positions of the different sections a very large number of arrangements and shapes becomes possible. By a slight variation of the dimensions to suit these standards it should be possible to adapt any design of house to the system. The various units are arranged with

Section of Walling.

Standard Wall Section : Lining Removed

wo-thirds the weight of concrete, and, aterial, can be moulded to any desired ke wood, it can be drilled, sawn, and d surface finish, but it does not warp urable as stone. By altering the pro- the ingredients, the actual properties crete " can be varied between some- limits. For the outer walls and roof ts in contact with the outer air, a hard ridges and projections which lock into adjacent members.



The outer frame of the standard units is of some thickness. When in position each portion of this frame abuts against, and is bolted to, the corresponding portion of the frame of the adjacent floor or wall unit. Each pair of such parts of the frames together form a post or joist measuring 9 in. by 4 in. in cross section, and each is able to take a compression load of some 60 tons before failure. These heavy members, formed at the abutment of each pair of adjacent sections, are spaced apart a distance equal to the width of a standard section, *i.e.*, less than 3 ft., and all run into one another and rigidly connected. By moulding heavy parts under windows and over doors, and by attaching internal fittings to these members, it is possible to avoid local weakness.

The possibility of condensation is avoided by the nature of the construction. The wall units forming the outer shell are of hard stone-like " Factocrete," impervious to moisture ; the inner lining forming the walls of the rooms is of the softer, warmer variety, and between the two is an air space over 8 in. thick.

" Factocrete " floor units are generally similar in construction to the wall units, except that they are reinforced with steel bars incorporated into the material, the lining in the base forming the ceiling of the room below. As designed for the ordinary small type of house these floors are sufficiently strong to withstand a loading, spaced uniformly over the floor, of 3 cwt. per sq. ft. over the whole area. The inner linings to walls and ceilings are put on in flat sheets, the junctions being covered by the picture rails, cornice, &c. The internal partitions are generally similar to the external walls, but of somewhat lighter construction. The stairs are also of " Factocrete " and are built up of a framework of posts and beams rigidly fixed to the heavy portions of the external wall units. The roof is built up of a framework of joists with a covering of impervious " Factocrete."

As the total weight of the " Factocrete " house is considerably less than that of a brick house, the foundation work is more simple.

The methods proposed are expected substantially to reduce the cost as compared with similar houses built of alternative materials. For a semi-detached house following the type approved by the Ministry of Health for use in housing schemes, and having a total floor area of 950 sq. ft., with three bedrooms, living room, parlour, kitchen, and usual offices, the selling price, including all internal fittings, should we are informed, be approximately £470. For a detached single story bungalow type of house, as illustrated, the price, complete with all fittings, should be approximately £350. These prices are exclusive of land, roadmaking, and drains, but include all fittings usually provided for houses of this class. The address of the Burney Unit System is 6, Broadway, S.W.1.

Lay-out of Bungalow (668 ft. super).

The " Burney " System of Construction.

NEW BUILDINGS IN LONDON

Old Broad-street.—Demolition work is practically complete in connection with the rebuilding of the premises in Old Broad-street, E.C.2, of Messrs. Lazard Bros. & Co., Ltd., bankers. Excavation work, preparatory to the construction of foundations, will commence next month. The new building will have a frontage to Old Broad-street of about 55 ft., the site, of irregular shape, extending back about 140 ft. Adams-court, a small passage on the left of the site, will be incorporated and built over. The premises will provide a large basement, accommodating several strong rooms, heating chamber, &c., whilst on the ground floor will be a banking hall, with a separate entrance. Another entrance will give access to five upper floors, which will be used as offices. A lift will be installed to serve all floors. The building will be erected on a steel framework with a front of Portland stone. The ground floor, retaining walls and foundations will be constructed of reinforced concrete, whilst the remaining floors will also be of fireproof materials. The windows will be of steel and bronze. The general contractors are Messrs. Trollope & Colls, Ltd., of 5, Coleman-street, London, E.C.2. The demolition is being carried out by Messrs. B. Goodman, Ltd., 33, Haggerston-road. The plans have been prepared by joint architects, Messrs. Gunton & Gunton, Finsbury House, Blomfield-street, London, E.C.2, and Messrs. Creed & Heal, 11, Gray's Inn-square, London, W.C.1.

Gresham-street.—The corner site at the junction of Lawrence-lane and Gresham-street, E.C.2 is to be covered with a new office building. The plans show a building comprising a basement of 12 ft., ground, and five upper floors. The elevations will be in best quality facing brick, relieved by stone dressings, the floors being supported by a steel framework. The ground area is about 850 sq. ft. The general contractors are Messrs. Y. J. Lovell & Son, of Marsham-lane, Gerrards Cross, Bucks, and 6, Bathurst-street, Paddington, W. The architect is Mr. Gervais Bailey, of King's House, Smith-square, S.W.1.

Willesden.—A new block of offices is being erected at the Edinburgh Biscuit Works, of Messrs. McVitie & Price, Ltd., at Willesden, N.W.10. A large block of three stories, costing about £30,000, is planned to be erected in brick, with stone dressings. The roof will be of slates, whilst the window casements will be of steel. Central heating plant will be installed, whilst electricity will be used for lighting. The general contractor is Mr. Thomas Rowbotham, of Coventry-road, Birmingham. Plans have been prepared by Mr. T. Willard, of Market-place, Rugby.

Muswell Hill.—A new branch omnibus garage and depot is to be built at Muswell Hill, N.10, by the London General Omnibus Co., Ltd., of Electric Railway House, Broadway, London, S.W.1. A brick building, supported on a steel framework, with a slated roof with extensive lantern lights and glazing, is to be erected, capable of holding about fifty 'buses. The floors will be of concrete, asphalted over, whilst there will also be tanks for storage of petrol, oil, &c. An inspector's office and lavatory accommodation will be provided, whilst large sliding doors will be fitted to the main entrance. The Company's architect is Mr. Stanley A. Heaps, of 17, Palmer-street, Westminster, S.W.1.

Whitefriars-street.—About two years ago the Associated Newspapers, Ltd., purchased the large site at the corner of Whitefriars-street and Tudor-street, E.C.4, formerly occupied by the Whitefriars Glass Works. It is now proposed to proceed with the building plans in contemplation, and to erect a large printing works and paper warehouse. The premises will comprise a large basement, ground floor and four upper floors. Steel framework will support the loads, and the walls will be of brick with stone facings. The floors will be of reinforced concrete, constructed so as to bear heavy dead loads, such as plant and paper stocks. The joinery, doors, &c., will be of mahogany and other hard woods, whilst the window casements will be of steel. Sprinkler installations and other fire prevention apparatus will be installed, also central heating plant, electric lighting and passenger and goods lifts. The architects are Messrs. Herbert O. Ellis & Clarke, of 3, Old Queen-street, S.W.1.

Threadneedle-street.—Actual construction and demolition work on the rebuilding of the Bank of England in Threadneedle-street, E.C.2, will not commence until November or December. It is proposed to divide the work, in view of its size, into three or four sections, and the portion to be dealt with will be the buildings now being vacated by the Bank Stock Office, Colonial Office, Power of Attorney Office, and Register Office situated on the left of the Bank's entrance in Lothbury. The Departments relating to War Bonds, Public Securities, &c., are now cleared, and this area will be taken in hand as soon as the remaining offices are emptied. The new buildings will be of six stories with, probably, further accommodation in a Mansard roof. The familiar outside wall of the bank will remain, and the new premises will appear above it. The plans have been prepared by Messrs. Herbert Baker, A.R.A., of 14, Barton-street, Westminster, S.W.1, and Francis W. Troup, F.R.I.B.A., of 14, Gray's Inn-square, W.C.1. The consulting engineer is Dr. Oscar Faber, D.Sc., of 5, South-street, Finsbury-pavement, E.C.2. The quantity surveyors are Messrs. Horder & Wells, of 40, Catherine-street, Westminster, S.W.1, and Mr. Hugh Watkins, of 13, Gray's Inn-square, W.C.1. The general contractors are Messrs. Holloway Bros. (London), Ltd., of Bridge Wharf, Grosvenor-road, S.W.1.

Regent-street.—Work has now started on the site at Nos. 252–260, Regent-street, W.1, where it is proposed to build the "Regent Arcade" of shops and showrooms. The new arcade will extend from Regent-street to Argyll-street, a length of about 150 ft., and will contain sixteen shops, provided with extensive window space, ground floor and basement accommodation. The arcade will have as a central feature a large domed glass roof. Above the ground floor, which will also have frontages to Argyll-street and Little Argyll-street, will be six stories of office accommodation, arranged for letting in suites. There will be four lifts installed. The building will be supported on a steel framework, the principal elevations being in Portland stone, and brick, with stone dressings, to Argyll-street and Little Argyll-street. The floors will be of fireproof materials, whilst the roof will be flat and asphalted. The contract for the foundations will be carried out by Messrs. Perry & Co. (Bow), Ltd., 56, Victoria-street, S.W.1, at a cost of about £20,000, whilst the superstructure will be erected by Messrs. Kirk & Randall, Ltd., of 146, Grosvenor-road, Westminster, S.W.1. The architect is Mr. S. Gordon Jeeves, 4, George-street, London, W.1, whilst the quantity surveyor is Mr. W. H. Webber, of 33, Furnival-street, E.C.4.

Tufton-street.—The National Library for the Blind propose to extend their premises in Tufton-street, Westminster, S.W., and have, for this purpose, acquired an adjoining area of some 5,000 sq. ft. A building of four stories is proposed to give accommodation for a library of 100,000 books. There will also be reading rooms, rest rooms, &c., and the premises, including their equipment, are expected to cost about £40,000. The plans have been prepared by Mr. Sidney Tatchell, of Messrs. Bourchier, Tatchell & Galsworthy, Bank Chambers, 32, Strand, London, W.C.2.

Barking.—A new warehouse is to be built at West Bank by the River Roden Co., Ltd., wharfingers. A one-story structure, of brick construction, with a roof of steel trusses covered with asbestos, is proposed. The floor will be of concrete. The plans have been prepared by Messrs. C. J. Dawson, Son, & Allardyce, of Clock House Chambers, Barking, Essex.

LAW REPORT

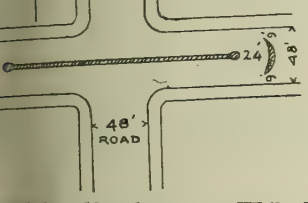
Shoreditch County Court.

A PAINTER who was wilfully pus steps by a drunken man, who was s charged, was the applicant in a Compensation Act claim, in the County Court recently, before Ju The applicant was Albert Simper, of road, Bow, a painter, aged sixty-e and the respondents were Messrs Gates & Son, of 12, Albion-squar painting and decorating contracto peared from the pleadings that th was at work on a pair of steps Pitfield-street, Hoxton, on May 15t steps were pulled away, with the re fell some 4 ft. to the ground, caus to his ribs and back. He was said t earning £3 15s. a week, and to be capacitated.

The defence was that the accide arise out of the applicant's emplo alternatively, that the injury was ca circumstances creating a legal liat third person to pay damages.

Mr. W. H. Duckworth, in openi for the applicant, said that while th was painting the steps were pulled underneath him by a drunken man, a were caused, which it was admitte tated him. The amount of the co had been agreed if the respondents liable, but they did not admit the There were three points taken in the the claim: the first was that there no accident; the second was that arising out of the employment; an was that, under Section 6, the man h compensation under circumstances w disentitle him to compensation from dents. Mr. Duckworth then went on the applicant never had a word to reference to a suggested compensat drunken man responsible, and did n suggestion one way or the other as to t of £20. What he did do was to refer to his solicitors, and they said he h to do with the £20, and, as a fact, h received a penny. Counsel subm when a man was carrying out hi a painter and someone came along away the steps, then it was an accide during his employment.

Mr. Justice Cluer said if the could have got the £20, he thought have lost his remedy under the Compensation Act. Of course, i to give him £100 out of charity nothing as it was from a stranger took it from the person who inju put himself outside the Act.



Counsel for the respondents sub the only acceptance he could point applicant was the tacit acceptance of suggestion of £20. He must have intimated an acceptance of some s

Mr. Justice Cluer said that h whatever to do with it. There we cases where the magistrate suggest sation, and the prosecutor had no or say in the matter. Continuing, said the only compensation it w the man was to get was that sugge Chairman of the Sessions. The therefore, was entitled to say whe was put before him that he did n contract, nor did he agree to tak pensation from the culprit. Th point must fail. As to the other p the injury arose out of his em not, he considered a painter w suffer from the acts of mischi that would be a cause arising employment. The mischief, or would be the removal of the pi and in the case before the Cou cause was the man seizing the l was the risk which he considered a out of doors was bound to run. F to find that this was an accident the man's employment. He un

tion had been agreed upon at 30s. per
n the date of the accident, and he
er an award for the applicant on those
th costs.

ROAD TRAFFIC

tention has been drawn to a proposal
lief of congestion in road traffic which
d in *Modern Road Transport* of October
proposal emanates from Mr. J. N.
hyay, and consists in providing long
ands to secure uniformity of direction
affic at cross-roads. The proposal
pon the alleged fact that "while it is
lly true that two lines of traffic can
y-side within 18 ft of roadway, this
rs in practice unless continuous lines
maintain abnormally slow speed. . . .
nes of traffic, therefore, can only be
d where the road is actually suffi-
ide to accommodate three lines of
extra width being necessary to enable
mount of flexibility." The appended
trates broadly the general lines of the

and is self-explanatory. While Mr.
hyay may be right in theory that to
roadway from an effective width of
wing for a 4 ft. island) to two effective
of 9 ft. each would not slow down the
et practical experience in London
daily that the least block on the road
causes delay. We do not understand
e moving from north to south in our
can fail to be impeded by the long
because the amount of turning and
in" involved would be worse than the
" we suffer from at present. We
d that the proposal is shortly to be
before the new London Traffic Com-
consideration, and we shall be inte-
hear the opinion expressed upon it.

Builders' Estates.

nes Murrell, of Pembroke-road, Seven
ssex (net personalty £8,679), £9,438.
ert Watt, (83), of Clifton-avenue, West
l (net personalty £16,422), £18,913.
illiam Molyneux, of Park-road, St.
ances (net personalty nil), £7,554.
T. Ward, of 14, Honywood-road,
r, £15,546.

Southsea Institute.

Institute, built at a cost of £11,000,
ed at Southsea recently by Major-
Sir John Daniell, K.C.M.G., The
is Mr. A. E. Tutte, of Portsmouth, and
ers are Messrs. John Lay & Co., of
treet, Portsmouth.

Liverpool's Concrete Houses.

verpool Housing Committee, after a
Amsterdam with the city engineer to
utch systems of house building, recently
ded the City Council to build 500
houses on the principles now in exist-
olland. The Council has agreed to the
dation (subject to the sanction of the
of Health) and, it is stated, has fixed
mum cost at £525 per house. The
Committee is now engaged with details
amme for building approximately 5,000
ouses. Ten systems of concrete con-
were experimented with in Amsterdam,
vere adopted. One system makes use
f reinforced concrete, measuring up to
14 ft., with a thickness of 6 in., which
d in position by a crane. The second
hich is similar to systems now used in
try, has a number of special features,
flooring with concrete slightly rein-

THE SCOTTISH BUILDER

SCOTTISH MUNICIPAL HOUSING

THE Housing Committee of Glasgow Corporation has recently been considering the question of the occupancy of dwellings in housing schemes by people who are able to afford houses of higher rent built by private owners. It is proposed to issue, prior to the reletting of houses at Whitsunday, a schedule to tenants reported to them as being in a better financial position than warrants their continued occupation of Corporation houses, asking them for particulars of their circumstances with a view to the sub-committee on letting considering whether the houses should be relet to them. This proposal was contained in the minutes prepared for the consideration of the Corporation at a recent meeting. The convener of the Housing Committee (Councillor Morton) recently stated that among the tenants of Corporation houses were 172 municipal employees, 11 Town Councillors, and three members of Parliament, and that 179 persons residing at Mosspark held licences to drive motor cars, while permission had been granted for the erection of 16 motor sheds and 11 for motor cycles. It was eventually decided to close the list of applications for houses in Corporation housing schemes and to issue a schedule to those already on the list requiring them to renew their request. The chief object of this action was to ascertain the number of citizens whose needs were most urgent. With regard to the new scheme Councillor Morton said there were so many stories of people with £1,000 or £1,500 a year having got Corporation houses that they want to ascertain the facts. People of that description, he said, could look after themselves, and should never have got houses. If any had done so by giving wrong information in their schedules the department would not relet. They did not build the houses for millionaires, but for the better artisan class.

SYNTHETIC STONE BUILDING MATERIAL

THE Fyfe-Stone Co. recently opened their new works which have been erected at Coltmuir Quarry, Bishopbriggs, Glasgow, for the production of building materials. It is proposed to produce a synthetic stone which will market at a price equal to the price of brickwork. It has the appearance of stone and is stated to be more permanent and less porous. The company will manufacture all forms of concrete building products from breeze partition slabs to ornamental pre-cast stone. A party of over a hundred connected with the building trade attended the opening ceremony, which was performed by Mr. G. D. Morton, who, in declaring the works open, set the machinery in motion. Mr. Peter Fyfe, in explaining the aims of the new company, said Glasgow required at least 52,000 new houses now, and she had little hope of obtaining anything like that number during the next seven years. Meantime the population was growing at the rate of 10,000 per annum, so that any system which would give houses quickly, and at a more moderate cost than at present, would be welcomed. Fyfe-stone could be built up in one-half of the time required for brickwork and, he estimated, would cost less. A 24 in. block could be put in its place very rapidly, and being sand or granite-faced, did not require any roughcasting to keep out the damp. By manufacturing 2,400 such blocks per day, as they would be able to do with their five special heavy pressure machines, they would be in a position materially to assist in solving the nation's housing problem. They were ready to turn out standard building units by the million. By building with these slabs or blocks upkeep charges were reduced to a minimum, building costs were reduced, and construction was speeded up.

NEW BUILDINGS IN SCOTLAND

Renfrew.—VARIOUS.—Bungalow, Ladysmith-avenue, for D. Fulton (plans by J. Y. Jeanie, Ltd., Johnstone); Bridge of Weir, bungalow, Stanley-drive, Brookfield, for J. Y. Jeanie, Ltd.; villa, Greenock-road, Bishopton, for Henry Wilson & Sons, Bishopton; house, Old Greenock-road, Bishopton, for R. A. McKaren.

PROPOSED NEW BUILDINGS

(*Continued from p.* 700).

Essex C.C. a site for the erection of a hostel for the County High School.

SHERINGHAM.—The U.D.C. approved plans: Two houses, The Rise, Messrs. Rice & Sons.

SLOUGH.—The U.D.C. has bought the Clock House and the Red Lion for the purpose of pulling them down and widening the west end of High-street, and ultimately erecting new offices.

SOLIHULL.—The R.D.C. proposes erecting houses as follows: Baddesley Clinton, 6; Balsall, 8; Barston, 4; Elmdon, 4; Lapworth, 12; Olton, 20; Shirley, 14; Tanworth, 32.

SUNDERLAND.—The E.C. recommended the T.C. to proceed with the building of the Bede Boys' School and the Bede Girls' School, each holding a minimum of 600 scholars, at a total cost of £132,000. The site for the schools is on the Durham-road.

THORNE.—A new secondary school is to be erected upon a site selected at the corner of St. Nicholas-road and Church-baulk, for the Doncaster E.C. Tenders for the building work are shortly to be invited.

THORNLEY.—The Miners' Welfare Committee has let the contract for the erection of a new Welfare Hall to Messrs. Cherry & Walsh, the total cost being about £7,000.

THROSTON.—A new school is being proposed. The Borough Engineer has been instructed to submit estimates.

ULVERSTON.—The R.D.C. passed plans: Seven dwellings, Bardsea, Mr. J. K. Casson.

UNDERHILL.—The Hertfordshire E.C. recommend that about 2 acres of land fronting Mays-lane as a site for a public elementary school.

WALTHAMSTOW.—Plans passed by the U.D.C.: Sheet warehouse, British Xylonite Works, Hale End, A. G. Barton; five houses, St. John's-road, C. W. Houchin.

WARRINGTON.—The T.C. approve plans: Three houses, Cambria-place, for the Fire Engine Committee. —A preliminary estate plan, prepared by Messrs. R. & S. Smith, for the laying out of land adjoining Alder-lane for the erection of approximately 500 houses, was approved, subject to certain minor alterations.

WARWICK.—The T.C. has had tenders for the erection of 41 houses on the Emscote site and recommends acceptance of the offer of Messrs. Standbridge & Parker to erect nine non-parlour type houses. Tenders for the further 32 are being considered.—Plans passed: Extensions to foundry, for Emscote Foundry Co., Ltd.; house, Beauchamp-road, for Mr. C. Gould.

WEST HARTLEPOOL.—The T.C. approved plans: W. Pearson & Son and C. V. Sutton, pair of bungalows, Eltringham-road; W. Manson, pair of semi-detached houses, Grantham-avenue.

WIGTON.—The R.D.C. approved plans: Bungalow Mr. Kilpatrick, at Hawkrigg House.

FIRE.

WALTHAM ABBEY.—Damage estimated at between £30,000 and £40,000 was caused by a fire to the premises known as the Waltham Abbey Flour Mills, occupied by Messrs. Stoddart & Hansford.

STAINED GLASS PAST AND PRESENT

AN account of an interesting window, the east window of Holy Trinity Church, Goodramgate, York, has been written by Mr. John A. Knowles, with all the knowledge and appreciation which we associate with his work; but more than this, the author includes a refreshing freedom from that almost superstitious worship of the past which so disguises its real value; this value depending not on any fortuitous and abstract considerations, but on the examination of the work and methods of the artists of that time. These we do not always find to have been perfect at all, nor is the work any the worse for that; on the contrary, it is only in this way that we can really give reasoned appreciations of the great qualities which their work included. When Mr. Knowles lays bare certain little peccadilloes in their methods of work, we begin to hope that the appreciation which we rightly bestow on their work may be estimated on the realities of its qualities as against those superstitiously bestowed. The account of this window includes very interesting particulars in regard to the subject matter, the heraldry, the technical approach, &c., and on all these different matters the writer contributes valuable information. In regard to the supply of glass at this date (*c.* 1470) we are told there was a serious shortage: "The reason for this state of things is probably to be found in the dependent position in which English glass painters were placed in having to import practically all their glass from overseas, and, in the case of York, to a large extent through the Hans factory at Hull."

While the particulars furnished about the subject matter of this window include particulars from which we learn about the life of the time, of the Guilds, of the derivation of subjects from foreign sources, and so on, they at the same time point to the necessity for amplifying pictorial representation with further subject matter. This renaissance of subject matter is a necessity in the recovery of a vital tradition for stained glass, which should grow out of our own life as well as that of the past. Nor are we prepared to accept the view that mediæval glass, in the twelfth, thirteenth and fourteenth centuries, reached a culmination beyond which it cannot go. The limits of any art are no less than those of the human mind, which ever renews itself in further interpretation where the creative impulse is free and healthily employed. Art grows out of the past, but does not live on it; on the contrary, in such ways only it droops and dies. Stained glass, like any other art, is always at the beginning in the hands of the true artist, and in this sense all the best things have yet to be done. The character of this renewal would seem to depend on the extrication of the art from its mere survival as tied to tradition, both in treatment and subject matter, f least part of art that can be learn hands of the artist it can never only we must look for the expansion of an so malleable and delightful from the which his own first-hand intimacies c will no doubt reveal to us. He will the past, but will not be its depend his own life, endowment and experie tribute as the finest flower of his wo

NEW LONDON SH ROOMS

WE illustrate on this page showing a portion of the Baths and Section of the new showrooms Nicholls & Clarke, Ltd., ma and merchants of building materia High-street, Shoreditch, E. 1. gressive firm has now added some 30 ficial feet of floor space to their al showrooms and warehouse, which no of the largest displays of builders' r central London, situated, as they are, Liverpool-street Station. We recen opportunity of looking over these pren it is difficult to think of any buildi which is not to be seen. There are l of fireplaces, baths, lavatories, ran closets, &c., in a variety of pleasing suit all purses and purposes; whil large assortment of door furnitur down-pipes, and similar items, sho that nobody would leave these without finding exactly what h A special feature is made of tile which are to be seen in many differe and shades; and of the "Marlow," fire-place and hearth, which Messrs. Clarke are shortly putting on the m addition to their own products, practi proprietary fire-place on the marke seen here. The completeness with extensions to the premises have be out will be realised when it is said th have their own workshops and fo

Such a large showroom must, of co adequate facilities for despatching customers, and for this reason a loa has been provided with a length o from which nine lorries or vans can simultaneously. A yard adjoining t has also been acquired for the storag of iron and stoneware pipes. With the for holding large stocks and rapid de firm claim that, when required, any be delivered within the London area day as ordered. Architects, builders, interested in building materials and invited to call and inspect these at any time.

A Corner of Messrs. Nicholls & Clarke's New Showrooms.

PATENTS

APPLICATIONS PUBLISHED.*

221,001.—A. Fahim: Crushing-mills.

221,017.—Dr. O. Schmidt and Dr. M. Hahnle: Method of producing a hydraulic cement and artificial stones for bituminous shale-slag.

206,169.—J. A. Kammerdiner: Jars for use in rotary well drilling apparatus.

221,135.—E. Kjde: Grabs on the single-rope system.

221,144.—G. Bennet: School desks.

221,148.—J. Kenyon: Guard for domestic fire-places.

221,149.—J. Smith: Sliding window sashes

221,235.—L. G. Nicoll: Decorated or ornamented woodwork.

221,286.—J. M. Ambrose: Shuttering support for concrete floors.

221,288.—E. Pollard & Co., Ltd., and E. Pollard: Dust-excluding devices for sliding sashes and doors.

221,292.—Indented Bar and Concrete Engineering Co., Ltd., and R. L. Bendall: Construction of concrete roads, tracks, paths, buildings, tanks, and bridges.

221,293.—F. Reddaway & Co., Ltd., and W. C. Gardiner: Feed belts or aprons of machines for manufacturing asbestos-cement sheets.

221,295.—E. C. R. Marks (Deutsche Gluhfaden-Fabrik R. Kurtz und Dr. Ing. P. Schwarzkopf Ges): Method of producing plates from refractory metals.

221,309.—W. Wallbank: Sash window fastenings.

221,342.—A. P. Laurie: Preservation of stone.

221,348.—J. Reid: Hand-operated cranes.

221,355.—E. W. Simpson and Valentine & Sons, Ltd.: Process for producing decorative effects on surfaces.

221,441.—P. A. Schols: Doors for buildings.

221,477.—W. H. Baxter, Ltd., and W. H. Baxter: Machinery for granulating, crushing and screening stone and ore.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

TRADE NEWS

A very complete account of the growth of the asbestos industry from 1871 to 1924 is contained in a 28 page booklet issued by Messrs. Bell's United Asbestos Co., Ltd., of 59½, Southwark street, S.E. 1, manufacturers of "Poilite" and "Everite" asbestos-cement sheets, slates, tiles, &c.

The October issue of Messrs. C. Baker's (244, High Holborn, W.C.) list of second-hand scientific instruments is now to hand, and, as usual, contains particulars of many instruments used in the architectural and surveying professions.

A simple type of concrete brick-making machine, known as the "Econbric" machine, is illustrated and described in a pamphlet issued by Mr. R. Orsmond, of 6, Parham-road, Gosport. It is stated to be capable of producing from 2,000 to 4,000 bricks per eight-hour day.

Messrs. Hine, Ltd., have taken offices at 145, Cannon-street, and they inform us their stocks of timber, both carcassing and joinery, are such as to allow of competition prices being quoted. Telephone No.: City 9419.

We have received from Messrs. G. L. Wilson & Co., Ltd., Tottenham, N. 17, a catalogue which covers practically the whole field of everyday sanitary ware and plumbers' brass-foundry. It is so arranged that all who possess this useful publication can insert, from time to time, new pages of prices or designs—a valuable innovation. Also extra copies of any particular page will be sent on request to Messrs. G. L. Wilson & Co.

Scottish Master Carpenters' Association.

The North-East of Scotland Master Carpenters' and Joiners' Association recently held their half-yearly meeting at Aberdeen. Mr. John Buchan, in the course of an address on the housing situation, said that looking broadly at the situation the prospects for the coming winter were none too bright. After dealing with the method of erecting a duo-slab concrete house, Mr. Buchan said it was extraordinary to note the rapidity with which these houses could be erected. There was another new system of building on the market which claimed to be both cheap and expeditious, namely, steel houses. The chief objection, however, was the cost. No one, he said, had ever suggested that a trial should be given to wood and, seeing that cheapness was the deciding factor at this time, he did not see why it should not be given a trial.

The British Empire Gas Exhibit.

The Architects' and Surveyors' Assistants' Professional Union recently visited the British Empire Gas Exhibit at Wembley.

Mr. Goodenough, in proposing "Co-operation between Art and Industry," said co-operation was the greatest need of the world to-day. Architects, in common with the gas industry, were interested in the homes of the people, as well as in institutions and factories, and between them they could do useful service for the community by providing that which was efficient as well as artistic, and by abolishing the smoke nuisance. The gas industry took pride in its work, not only because it served the individual, but they also served the civic community by the purification of the atmosphere and the nation by the conservation of coal. There was also the fact that the gas industry was helping to solve the unemployment problem by employing more people than ever before.

Mr. C. Lachlan, chairman of the executive committee of the Architects' and Surveyors' Assistants' Professional Union, in responding, said to-day the real patron of art was industry, and it was a noble work for them to combine to bring about the elimination of fog.

After luncheon at the Great Central Hotel, Marylebone, the company visited the Gas Exhibition at Wembley.

-No. 4263. NOVEMBER 7, 1924.

AD NAUSEAM

HE opinion has been expressed that everyone was tired of hearing about housing except those who wanted houses. The truth in this does not necessarily indicate the magnitude of the problem; it may merely indicate the permanent condition of ness which seems to be essential to any problem which nisfortune to develop into a political counter. Although nt election has again brought the subject prominently he public, it is difficult to believe that a sound tive policy can emerge from the ruck of political nda.

y political party has had an opportunity and none has remedy. Long ago the problem developed into a between economics and sentiment, and the claim of y to have built so many houses is merely childish when that the financial losses are only limited by the size of ing programmes. In the housing shortage lies the real , despite the fact that the politician has adroitly it with the ideas of the housing reformer. By this must be obvious that the simple problem of buildses regardless of cost is not so simple as it was appear. Cause and effect can sometimes be detected ll circle, but we deny responsibility by proving that tion is controlled within a larger circle. The truth of bvious, (and to be fair it is a reasonable excuse) when e that any political party which hazards a solution of ing problem inherits and accepts a first cause in the estriction Act. This humane Act, designed to avoid during the period of the war, has, without doubt, l results which can never have been contemplated. s from the State could have met the situation at the is certain that we have since paid a hundredfold. We at it is idle to recriminate, and we mention the matter s an excuse and partly because the remedy—or one at least—may be found in that direction. No political e are afraid, is likely to risk unpopularity by amending , even if it could be proved that the immediate hardould be worth the sacrifice for the ultimate gain. It d doubt that many people are avoiding their responsiy refusing to build, and spending their money in other s, but in fairness it must be said that a large share esponsibility must be placed upon any Government eeps up the cost of building by maintaining artificial conditions. In these matters it is almost impossible ot unfair) to make distinctions between those who are f houses and those who want them, and once embarked olic schemes of this nature it is difficult to see an end Under present conditions it seems to us that where no limit to the magnitude of the problem we might y expect our difficulties to increase.

act that the problem is so attractive to the politician ief reason that we have come to expect so little from nt. We think we are generous when we say that the nistakes which have been made in the past should be on in the light of inexperience, instead of attributing party failings or principles. We will not argue the here whether it is an economic fallacy to believe we anything from State funds, but we can at all events he principle of giving is too facile to be considered as atesmanship or to be the monopoly of any political n saying this we may appear to have contradicted since we have already stated that the simple problem and giving generously, has its complications. It is our misfortune that these complications are more serious than the problem we set out to solve.

A year or two ago the problem was clearly defined; we looked for either of two solutions. Private enterprise in building houses could not be expected unless rentals and costs of building reached an economic level. Either one went up or the other went down; and of the two it was generally expected that building costs would fall with other industries in the general deflation. And this is the crucial point in the whole problem: the costs of building would have fallen but for our housing schemes. No one, we think, disputes the fact that building costs are high, and beyond the reach of a great number of people, taking into consideration present monetary values. If we argue that rental values are not on an economic basis we can account for the scarcity of houses, but we do not explain away the high costs of building. On the contrary, the economist tells us that where there is no demand prices automatically fall and adjust themselves to the demand. No clearer instance of this can be given than the recent motor exhibition. Prices have fallen, and from all the reports we have read we gather that the demand this year constitutes a record. Arguing on these lines, we come face to face with the fact that in house building there is no general demand, but a very definite political demand which upsets the whole economic machinery. At the moment, the country is immersed in this apparently hopeless tangle, hopeless in the sense that many politicians are astute enough to see that the economic remedy follows the way of unpopularity.

The greatest burden we have inherited from the politicians is the long view which refuses to see the immediate problem, or that there is more than one method of settling it. The immediate problem is the shortage of houses, and we are given a Government housing programme extending over fifteen years, and subsidies for forty years! A policy of this nature inevitably leads to a hopeless economic condition, and the fact that costs of building have risen is as natural a result as that water should find its own level. Increases in building wages and materials are the direct results of our Government housing schemes, and the bigger the programme the more certain is the demand for higher wages. A definite building programme extending many years ahead is an economic temptation which has been proved to be irresistible.

We come to the conclusion, therefore, that so far as the politician is concerned we cannot look for any assistance where the economic remedy involves unpopularity. The most we can hope for is that he will not legislate for posterity, and will realise that the short view is the one which is potentially least dangerous. It is becoming more evident that the solution of the housing shortage and building costs is likely to depend on the adoption of substitute building materials.

We have been discussing the political view of the housing problem because it is of vital interest to the building industry, but the fact remains that we are spending hundreds of millions of public money, and the position is far from satisfactory. There is a social problem involved outside the scope of the building trade, and we believe that the workers have failed to see the chink in their armour. There is a housing shortage; there is a shortage of men in the building industry; and unemployment, generally, is rife. Costs of building are so high that only a small proportion of the nation will consent to build houses. The public has a right to be critical, and we may, therefore, take it as certain that it will support whole-heartedly any scheme which aims to supply houses quickly and cheaply.

NOTES.

Sir Aston Webb, P.R.A.

ALTHOUGH he was not present at the inaugural meeting of the new session of the Royal Institute of British Architects on Monday, as had been expected, we are glad to know that Sir Aston Webb, P.R.A., has so far recovered from the serious motor accident which he and two other eminent Academicians met with in the spring that he has been able to assume a gradual resumption of business activities. Sir Aston's distinguished career as an architect, and the many great and varied services he has rendered to the architectural profession and to the cause of architecture, called forth the widest expressions of sympathy for him in his unfortunate accident, and we are sure we are echoing the feelings of the profession in offering him hearty congratulations upon his recovery.

The President's Address.

THE form of the able address which Mr. J. A. Gotch, Hon. M.A. (Oxon), President of the Royal Institute of British Architects, delivered on Monday at the inaugural meeting of the new session, appeared to be in some measure the inevitable result of the unification controversy which finally resulted in the amalgamation of the Society of Architects with the Institute, and the determination of the Institute to promote a Bill in Parliament for the registration of architects. Mr. Gotch explained that though the Institute was founded some ninety years ago to promote the study and practice of architecture, and was a learned Society, "in the present day it is incumbent upon it to promote the interests of architects as well as those of architecture. This means a widening of its scope, an increase in the directions to which its energies may be guided: not so much a change of aim as an increase in the objects to be aimed at." This, we believe, to be a reasonable interpretation of the demand within the Institute for both unification and registration, and with the right guidance and co-operation of all members and parties there is no obvious reason why the interests of both architects and architecture should not be promoted by an increase in the activities and scope of the only society representing the profession. The Institute is pledged to promote a Bill in Parliament for the registration of architects, and the President stated that such a Committee is now engaged upon the work of preparing a Bill. The amalgamation is not yet legalised, and it has entailed a supplemental Charter, but the sanction of the Privy Council will in all probability be given within a short time.

Council Elections.

WE give the address on p. 714, and it is unnecessary to discuss it in detail, but we cannot refrain from expressing our satisfaction, which we believe will be shared by most members of the Institute, with the changes proposed in the election of Council. "Instead of the whole body retiring every year, only one-third will do so, thereby ensuring on the whole a continuity of policy, but at the same time affording opportunity for a gradual yet complete change, should the Council endeavour to pursue a course opposed to the wishes of the general body." This, we agree, is a reform as wholesome as it is simple, and is, moreover, the method adopted by other professional bodies. The address strikes a hopeful and progressive n suggests that the Council is ful of their responsibilities and, wha have the will to face them.

Architects and Builders in Parliament.

VERY few repres of the architectu fession or the bui dustry have been to Parliament, a a few sought the honour, bu ever the cause the result is the s is to be deplored. We believe professions and industries sh directly represented in the ch lative body of the country. A when architects are proposing Parliament for registration, a Parliament has made itself, we think, responsible in the wa for the housing of the people, a and builders should take part lation vitally affecting their inte those of the nation, and it is unf that there appears to be a lack o spirited men in the profession industry able and willing to m inevitable sacrifice of time and n secure representation in Parliame such candidate, who has been is Sir Frederick Rice, and his su the Harwich division of Essex w been heard with much satisfactio many friends in the building indu elsewhere. Sir Frederick is the of Messrs. Rice & Son, building

es hi- e.

THE recent movement to interest the public in architecture has beyond doubt met with a good deal of and those who are sanguine believe that the general public day take as much interest in ire as they do in the drama encouraged by the stimulus s been given to public interest cal and modern architecture by .A., the Architecture Club, and of University Extension lectures. more might be done by means s we have little doubt, given the the lecturer to make the most bject, and the selection of the ns and districts. The indirect, direct, effect of successful public may be very great, and such to be encouraged in every way. narks are suggested by the fact rge attendance—an average of each lecture—at Sir Banister present course of University lectures on Mediæval Archi- the Central School of Arts and Perhaps the fact that the lec- had twenty-five years' experi- lecturer for the University of London may have something to do with this, but it is certainly a matter for congratulation that members of a public willing to pay fees to hear lectures on architecture are being turned away because of lack of accommodation.

Housing Policy.

WE deal in our leading article this week with the political aspect of the housing problem. No political party, we hold, has any monopoly of political idealism, but it requires great strength of character to risk a certain amount of unpopularity instead of following an unimaginative and stagnant policy with the idea of winning devotion from the masses. Every housing policy hitherto has been a hopeless mixture of economics and sentiment; they only vary in the mixture. To the economic purist a rent subsidy is of course anathema and there are undoubtedly many serious objections to a policy which only stern necessity can justify. Without a temporary measure of State assistance in some form there is not the slightest prospect of the necessary houses being built in the manner in which we have hitherto been building them. The familiar statement that "the high cost of construction is one of the fundamental causes of housing shortage" is generally accepted, but we believe that the statement would be much more accurate if cause and effect were inverted. When this point is realised by any Government we may reasonably hope to see the housing question settling itself.

An Interesting Competition.

PARTICULARS were advertised in our last issue of an interesting competition inaugurated by the Worshipful Company of Fanmakers with a view to promoting the study of modern methods of ventilation. The Company has decided to institute an annual competition, and to award its silver medal for an essay adjudged the best by the assessors, Mr. John W. Cooling, M.Sc.(Tech.), A.M.I. Mech.E., Mr. Alan E. Munby, M.A., F.R.I.B.A., and Mr. H. D. Searles-Wood, F.R.I.B.A., and have chosen as the subject for 1924–25 "The Ventilation of a Police Court." The subject is a good one of practical interest, and we hope there will be a keen competition, on inaugurating which we congratulate the Company. We are always glad to hear of cases in which the ancient Livery Companies are endeavouring to promote the art or science in connection with the industries which they represent.

The County Fire Office.

THE demolition which has just begun of the County Fire Office almost completes the destruction of the Quadrant associated with the work of John Nash. It is not much use distressing ourselves about such changes. It is another thing to assume that they are due to any architectural revival such as that of the Regency period when Nash set about to improve the metropolis. No such public spirited aim can easily be associated with the changes which are transforming Regent-street. The County Fire Office, we are told, was the only monument of the work of Robert Abraham and was possibly the best example of the revival of that time, and we can but regret its disappearance and hope that the building which is to take its place will worthily replace it. It is possible to exaggerate the merits of Regency work, which though not without attractive characteristics, cannot be said to include any very exceptional distinction when compared with other greater periods of development.

Two Heads.

THE illustrations which we give on page 708 represent two heads carved by Mr. E. S. Frith. The stone head was exhibited at the Royal Academy of 1924, and shows particularly fine and vigorous modelling, eminently suited to the material in which it is executed. The treatment of the hair is to be noted, as is also the handling of the planes of the face which, in spite of sound modelling in detail, retains considerable breadth and simplicity. The bronze head indicates a different technique, and one moreover which achieves distinction by execution in this material. The age of the old man is particularly well portrayed, and shows sound perception as well as ability.

GENERAL NEWS

Professional Announcement.

Mr. Alexander James Smith has taken offices at Embankment Chambers, 19, Villiers-street, W.C.2, as a constructive engineer and fireproof floor specialist.

Shrewsbury Castle.

Sir Charles Nicholson's work in connection with the ancient features of the Castle has made it possible for the main hall between the towers to be restored as in mediæval days. The hall is to be used as the Council Chamber for the borough.

Mill Hill School.

The science buildings of Mill Hill School were recently dedicated to the memory of students of the school who fell in the war. The buildings were designed by Mr. Stanley Hamp, and consist of laboratories for physics, chemistry, biology, and geography, large lecture theatres, a museum, handicraft workshops, and engineering and wireless rooms. The cost of the buildings was approximately £12,000.

South Wales Institute of Architects.

In the thirty-fourth annual report of the South Wales Institute of Architects, the President, Mr. Percy Thomas, F.R.I.B.A., states, with reference to the recent amalgamation, that the number of their members who have become corporate members of the R.I.B.A., has increased from 40 to 76. The report contains information of use to architects and others connected with the building industry in South Wales, and records the activities of the Institute during the past year.

University of London.

The Jarvis Scholarship given by the Royal Institute of British Architects has been awarded to Mr. M. A. Sission, a student in his fourth year, in the University of London School of Architecture. The Victory Scholarship of £100, given by the Society of Architects in connection with a competition for a design for a public school (illustrated in *The Builder*) has been awarded to Mr. C. H. Short, a student in his fifth year, of the University of London School of Architecture, and formerly Ronald Jones Scholar.

Booth Memorial.

It has recently been announced that the work in connection with the William Booth Memorial at Denmark-hill, London, has been entrusted to Sir Giles Gilbert Scott, R.A., and Mr. Alexander Gordon, F.S.I. Sir Giles, as consulting architect, will be responsible for the preparation of the plans, and all the necessary details relating to the architectural work will be carried out under his supervision and authority.

The scheme embraces the erection of a large training college at Denmark Hill, where the Salvation Army has acquired a large extent of land, comprising educational buildings and hostels and a large tower costing £10,000, surmounted by a beacon visible at night over a large area of South London. The approximate cost will be £200,000.

Town Planning Institute.

The ordinary general meetings for the Session 1924–5, which will be held on Fridays, at 6 p.m., are as follows:—November 14, Presidential Address, by Mr. W. T. Lancashire, M.Inst.C.E.; December 12, Bradford Town Planning Schemes, by Mr. F. Marsden, M.I.M & Cy.E.; 1925, February 13, Birmingham Town Planning Schemes, by Mr. H. H. Humphries, M.Inst.C.E.; March 13, Clayton Town Planning Scheme, by Mr. W. Carby Hall, C.B.E., F.R.I.B.A.; April 24, Bromley Rural District Town Planning Scheme, by Mr. E. G. Allen, F.R.I.B.A.; May 29, Croydon Town Planning Schemes, by Mr. G. F. Carter, M.Inst. C.E.; June (date to be fixed), Annual General Meeting.

CORRESPONDENCE

Concrete Blocks *v.* Brickwork.

Sir,—I am not financially interested in the making of bricks or concrete; but I am very much interested in the providing of the necessary thousands of dwellings for the people. Whatever may be the rival interests of brick and concrete, there is no doubt that even if everything else were plain sailing, and there were no industrial disputes, there is not a sufficiency of skilled bricklayers, work they never so hard for many years, to provide the necessary houses.

When I was in the United States I slowly and, I think, rather reluctantly became a convert to concrete. I do not believe the Americans build the special quality of house which would appeal to Englishmen, just as I am conscious that through non-scientific manufacture and a lack of the artistic sense concrete houses in England are sometimes unsatisfactory and unattractive. In such cases my opinion is that the cause is defective workmanship and limitation of knowledge of what can be done in making concrete dwellings not only useful but in a variety of colour tones which can be exceedingly pleasant to the eye.

It is a regrettable thing to say, but I am convinced that much of the objection to concrete, though happily lessening, is due to ignorance, to prejudice, and to our natural characteristic in being slow to adopt new ideas till they have been successful in other parts of the world.

In writing this I have no antagonism to bricks. All I am anxious about are the very necessary houses, whether brick or concrete. So it would not be a bad thing if the Government refused to allow great buildings, viaducts, railway stations, and such works, to use bricks, but found some other material, such as concrete, and so focus the supply of manufactured bricks in this country upon house building.

I believe the house of the future will be of concrete; but there is no reason why those who desire brick houses should be victimised because so many bricks are used in big undertakings when concrete could be used, and which has proved, for special work, to be more lasting and more efficacious than brick.

JOHN FOSTER FRASER.

COMPETITION NEWS

New Offices, Nairobi.

Designs are invited for new railway offices to be erected in Nairobi, Kenya Colony. Premiums of £200 and £100 are offered respectively. Conditions can be obtained, not later than February, on the payment of One Guinea, from the Crown Agents for the Colonies, Millbank. The assessor is Mr. William Dunn, F.R.I.B.A. Sending-in day at the offices of the railway, Nairobi, February 28, 1925. (See advertisement this week.)

Barrow Hill Memorial Club.

Designs are invited for the extension of this club. The total expenditure for alterations and additions is not to be more than £4,000. No payment will be made by the trustees for drawings or plans (which will be returned) submitted, but the accepted architect will be engaged to carry out the work. Sending-in day, November 10. Particulars from the Secretary, 10, Station-road, Barrow Hill.

[Members of the R.I.B.A. are asked not to take part in this competition until the conditions have been revised.]

Jugo-Slav Competition for Landscape Architects.

The Department of the Board of Trade has received from the Legation of the Kingdom of the Serbs, Croats, and Slovenes particulars of an international competition open to landscape architects, &c., for the submission of plans designed for the elaboration of the general plan of the Toptchider Park, near Belgrade.

The prizes for the best plans submitted are as follows:—1st prize, £400; 2nd pr 3rd prize, £200; 4th prize, £150; £100.

In addition, the sum of £250 is se the purchase of designs failing to sec

Plans must be submitted to the M Agriculture and Water, rue Prole Belgrade, by December 31, 1924. the competition and plans of the pre may be obtained from the office of th at that address.

Christian Science Church, South

Designs are invited for a new ch Sunday school at the First Church Scientist, Southport. Premiums of and £30 are offered respectively. The are Messrs. J. E. Sanders & Son, A 219A, Lord-street, Southport, to whor tion should be made, accompanied by of 10s., returnable only to those wh designs.

Other Competitions.

Other competitions still open in following (the dates given are, first the date, and second the issue of *The* which full particulars were given):- Hall (May 1). Manchester Art Gallery Aug. 22). Essays on Ventilation (no in day announced; Oct. 31). Valh out (June 30, 1925; Oct. 31).

CONCRETE CHURCH

At the meeting of the Architectura tion last week (reported in our last reference was made in his paper by the Mr. H. S. Goodhart-Rendel, to a church at Le Raincy, and co interest in this building was evinced who took part in the discussion. Th which was designed by MM. Perret, is i in this issue. It is built entirely of concrete, and is notable for the larg of glass area in the walls, and the fac concrete is left as it came from the without being covered in any decoration consists of simple ornamer on the structure in the operation o the concrete by the design of the f none of the ornament was applied forms were removed, and the indent the reeded columns, &c., were fo inserting strips of wood of the requi inside the shuttering before the con poured. The church was built as a war and it was essential the cost should to a minimum, the total cost being It covers an area of 13,300 sq. ft.; th 143 ft. high. ADELAIDE HOUSE

By A. E. RICHARDSON.

It is not inopportune to call attention to the remarkable office building now approaching completion on the north side of London Bridge. In a few weeks it will be current news in the public press, but it is not too much to say that it has already taken its place in the scheme of the City as an outstanding example of monumental art. Here is a building reposeful in line and free from eccentricity that owes little to foreign inspiration; it is not even faintly reminiscent of anything that has gone before, either in the Old World or the New. When it is considered that copybook exactitude was attempted by the Victorians, and that during the past quarter of a century every effort has been centred on the revival of scholarship, such a novel departure from precedent cannot but have an exhilarating effect on contemporary work.

Sir John Burnet and his partners have in the new building accomplished much for civic architecture on the great scale, and have demonstrated how vital expression can be given to a building of commercial character.

Many new buildings in the City are being erected; they are mainly, so far as the public is concerned, street frontages, for it rarely falls to the lot of the average architect to deal with a block on an isolated site. When the scheme was first proposed it was thought to be a dangerous experiment to erect a building at one end of London Bridge which would dwarf Fishmongers' Hall, mask the Monument, and obscure the Church of St. Magnus. The result, as now familiar to Londoners who approach the city from the south side of the Thames more than justifies the work of the architect, whose judgment from the outset has been unerring. With two such buildings as the new Cathedral at Liverpool and Adelaide House, as well as the advance made in domestic work for the people, the signs are evident that building art in this country has a vigour and a purpose that challenge foreign competition. It would be lamentable to import the form of English buildings from Holland or Germany, or to continue to rely for inspiration obtained at second-hand.

In the past much fine work has been under the shadow of revivals, confusing both to the public and the practitioner, but it can be conceded that from the welter of conflicting opinions the desire for the new has had its birth and that to be "modern" in a legitimate sense is both sane and logical.

Viewed in the autumnal sunshine of the past few days, the new building, in its dazzling whiteness, has seemed to impart a new splendour of colour to this quarter of London. It is in marked contrast to the strong black of the granite arches of London Bridge, as it is to the silvery weatherings of Fishmongers' Hall and the towers of Wren's churches. It is a building to be seen from various points of view, first rising cliff-like from the water's edge, with the funnels and masts of steamers contrasting with the vertical striations of the stone, while mists of smoke and vapour paint the lower reaches of the Pool and add to the charm of the river perspective. It has its charm also when seen from the bridge level, to which its scale is in harmony, and from the narrow depths of Thames-street. Adelaide House owes much to its completeness and homogeneity. Whereas many London buildings are made up of small interesting parts, this new building in its expression symbolises a oneness that is its most convincing quality. It is a building of many windows, but these are contained within a series of vertical lines and form part of the general texture without loss of surface. The basement story is of granite, and the upper part, including the coved cornice, is built of dimensional stone, precisely shaped and fitted. Perhaps it is the reticence of the design combined with the subtle inclination of the main surface that aids in the effect of solidity and elegance characteristic of every part. It is a building that is neither unduly horizontal nor vertical, possessing an even balance and rhythm contrasted by the dominant cornice and the unusual width of the entrance. The work, as originally schemed, included an attic story with a secondary cornice of deep

Adelaide House: Entrance. Sir John Burnet, A.R.A., & Partners, Architects.

CLASS-ROOM ACOUSTICS

By HOPE BAGENAL, A.R.I.B.A.

MMON complaint in the modern hygienic om is the long reverberation arising ly from the use of hard patent floors sters. These materials, admirable for ess, present a hard smooth surface and owerful reflectors able to throw a sound rds and forwards between opposite sur- nany times before its energy is ex- . Hence syllables, the units of sound ch, are prolonged, and undesirable such as coughs or scrapes of the foot gnified. A strain is thus caused on the n of the children and irritation to the . A quiet room economises nerves. ration in a room of comparatively ize used for speech of a conversational more annoying than in a large hall, some prolonging of tones is expected owed for.

ge class-room in the nursery school of Children's House," in Eagling-road, esigned by Mr. C. Cowles-Voysey, pre- an interesting case. Cleanliness had e first and very necessary requirement, had been fulfilled. The room was bright and cheerful, and there were traps. The floor was covered with a attleship linoleum and the walls and in plaster had a hard finishing coat. e reverberation resulting from these ns caused trouble. A thick carpet on r would have absorbed the sound but also have collected dust. It was de- place an absorbent on the ceiling in m of Cabot's quilt, upon battens l by a good canvas stretched tight. It ided to make some rough practical tests and after the installation of the quilt ns of a portable bellows and three organ pipes of pitch C3 (256), C4 nd C5 (1024). These pipes gave a s less than the standard loudness on Sabine based his calculations and . The length of reverberation was d by ear upon a stop-watch, and the f a large number of readings was The tests were carried out at night, and only then in rare intervals of silence. The room in its initial state, windows closed, two persons and three articles of wood furniture present, gave on the pipes the following reverberation:—

C3, 6.6 seconds; C4, 5.6 seconds; C5, 4.4 seconds.

It was decided to place first one layer of the Cabot quilt on the ceiling, and if that was found, upon testing, to be insufficient, to add a second layer. The single layer reduced the reverberation to:—C3, 1.3 seconds; C4, 1.3 seconds; C5, 1.1 seconds.

The change was noticeable immediately on entering the room. Conversation which had been difficult was rendered easy, and it was decided that a second layer of the quilt was unnecessary. The reduction for C4 (ordinary speaking voice pitch) was from 5.6 seconds to 1.1 seconds. The canvas screen covering the quilt was distempered with a thin coat. An oil paint on the canvas would have caused it to act as a slight reflector for high notes and would thus have minimised the absorbing power of the quilt.

It is interesting to compare these results with the theoretical calculations based upon Sabine's formula, which were made from the drawings and from approximate coefficients of absorption. The volume of the room was 14,100 cu. ft., the plaster on the walls and ceiling was taken at 0.017 (or 1.7 per cent.) absorbing. The glass was taken in with the plaster; the linoleum floor was taken at 0.03 (or 3 per cent.) absorbing. Allowing for two persons present at 4.7 per person, Sabine's figure (two were required to make the practical tests and should therefore be allowed for), the reverberation for C4 from the formula $t = 0.05 \frac{V}{A}$ was found to be 7.4 seconds for the room in its initial state. This calculated figure, 7.4 seconds, is longer than that actually found on the pipes for C4 (namely, 5.6 seconds), but the pipes, as already noted, were less than the standard loudness, and the "threshold," or point of silence, was difficult to detect accurately in the practical experiment. With fifteen persons present—a normal class—the calculations showed 4.5 seconds. At the ordinary speed of sound this would mean that a noise of a scrape of the foot traversed the room backwards and forwards some eighty times before its energy was absorbed. But at the same time the room would be bright for choral music. Upon further calculations the result of introducing 1,116 sq. ft. of quilt sufficient to cover the ceiling was found to be a reduction from 7.4 seconds to 1 second. This was taking the quilt at a coefficient of 0.5 (or 50 per cent.) absorbing—a figure well on the safe side for a single layer of the material. The effect of this reduction on choral music would be to deaden and reduce tone.

An illustration is given of the ceiling completed. The quilt is more efficient if laid with an air space behind it. It consists of eel grass in a brown paper envelope, and has the advantage of being moth-proof. It is slightly resonant and appears to reinforce tones at certain pitches. This has advantages and disadvantages. There is an advantage in treating the ceiling instead of the floor owing to the fact that the ceiling presents the greatest surface at a wide angle to the speaker. This makes it more efficient either as a reflector to increase sound or as an absorber to reduce sound. In the case of the class-room the ceiling is not required as a reflector and may therefore be rendered absorbent. The following comments upon the room under the new conditions are given by some of the teachers in a letter from the secretary. "The nursery school superintendent tells me that previously the children could not hear her speaking to them a few yards away, and it was quite impossible to make anyone hear on the other side of the room. This is now all right. There is still a slight echo. The effect on singing is slightly deadening."

"Another worker who has a group of about fifty children in the schoolroom on Sundays tells me that there is no echo now. The singing is perhaps not quite so good . . . one cannot make the place ring as previously . . . but one cannot have things both ways."

The work was carried out by the May Construction Company.

View showing the treatment of the Ceiling.

ON Monday last the opening general meeting of the Royal Institute of British Architects for the 1924-5 session was held at 9, Conduit-street, Regent-street, W.

The Council Dinner.

Amongst the guests of the Council invited to dinner before the meeting were His Grace the Marquess of Northampton; The Very Rev. the Dean of Peterborough; The Earl of Crawford and Balcarres, K.T., P.C.; the Rt. Hon. Lord Charnwood; the Rt. Hon. Lord Sumner; Sir Edwin Savill (President of the Surveyors' Institution); Mr. A. J. Taylor (President of the Society of Architects); Councillor Edgar Horne (Mayor of Westminster); Sir Thomas Fermor-Hesketh, Bart.; Sir George Frampton, R.A.; Sir Ryland Adkins, K.C.; Mr. John Bond (Clerk, Kettering U.D.C.); Mr. F. T. Verity, F.R.I.B.A.; Mr. L. M. Gotch; Mr. H. G. Gotch; Mr. H. Hankinson; Mr. H. T. Bye; Mr. Basil Davis; Mr. E. J. Partridge; and Major A. F. Vigor.

Inaugural Address.

After the preliminary business of the meeting, the PRESIDENT (Mr. J. Alfred Gotch, F.S.A.), delivered his inaugural address, in the course of which he said several events of great importance to them as an Institute had happened in the world of architecture since they met at the opening of last session, and perhaps he might be allowed to refer to them in some detail, even to the exclusion of remarks upon architecture as an art. After all, architecture had to be practised by architects—in the main, at any rate—and matters which affected the well-being of architects must to a certain extent affect architecture also.

It had become necessary of recent years to readjust their views as to the aims or mission of the Institute. It was founded some ninety years ago to promote the study and practice of architecture; it was a learned society quite as much as it was an association of architects banded together to protect and promote their own interests. But since the days of its youth it had seen the number of practising architects increase tenfold; circumstances had changed in every direction; the outlook of the world was different. Almost every conceivable occupation now had its society which endeavoured to regulate not only the relations between its own members, but also the relations between its members and the public. It would be unwise, and indeed impossible, for any old-established body such as theirs to ignore this tendency, and it was necessary to recognise the fact that in the present day it was incumbent upon the Institute to promote the interests of architects as well as those of architecture. This meant a widening of its scope, an increase in the directions to which its energies might be guided; not so much a change of aim as an increase in the objects to be aimed at.

The Institute was, in fact, adapting itself to the changed conditions and had shown that it was so doing by taking its share in the recent negotiations which ended in the amalgamation of the Society of Architects with themselves. That object, which had been pursued for the last twenty years, but which, for one reason or another, had not hitherto been gained, had now been successfully achieved, owing chiefly to its intrinsic merits and partly to the goodwill displayed by both sides in their prolonged and delicate negotiations. The fusion would strengthen the Institute, especially in its relations with the public, to whom it could now speak with the voice of a united profession. On behalf of the Institute, he would welcome the Society into their ranks, and rejoiced to think that they were with them and would share the high aims which animated them and the great responsibilities which devolved upon them. They must all recognise that to forgo a separate existence was no small sacrifice, and they trusted that the sacrifice would be rewarded by the increased strength and wider opportunities which the fusion would confer.

It must not be forgotten that, however much they might have widened their borders, they adhered to the essential principle that a definite standard of efficiency must attach to membership of the Institute. They owed this to the public quite as much as to themselves; and the public might feel reassured as to their intention of maintaining a standard by the fact that their next step would be the promotion of a bill for the registration of architects after they should have passed a qualifying examination. Not only on its own merits was such a bill required, but they were pledged to its promotion by the terms of their fusion with the Society of Architects. He did not propose to go at length into this question at the moment; it had been discussed, demanded and denounced so much and so often as to leave nothing fresh to be said. But this, he thought, might be observed—that there was a strong and widespread feeling in its favour, especially among their provincial members. Difficulties there would be, especially those attaching to a private bill, but these would not deter them from pursuing their object; and a committee, formed for the purpose was now engaged upon the work of preparing a registration bill.

This successful amalgamation was the most outstanding event of the past year. It increased their membership, and consequently their funds, for which—needless to say—they should find good use; and it brought a large number of architects within reach of the help and discipline of the Institute. The amalgamation was not yet legalised; it had entailed a supplemental charter and certain changes in their by-laws, and these had to be sanctioned by the Privy Council; but the necessary steps were being taken, the process was well advanced, and as there was no opposition it should be successfully completed within a short time.

It would be within their recollection that already some two years ago they had decided to amend their by-laws, largely in matters of phraseology; the present opportunity had been taken to effect these amendments and to introduce one or two others which were of considerable importance. It had been felt for some time that their method of electing the Council was open to improvement. The need for change was not pressing in the long series of quiet and uneventful years to which some of them looked back with secret satisfaction. But when acute controversies arose, it was found that election appeals were highly efficacious in promoting the views of those who resorted to them, with the result that more than once a clean sweep was made of the old Council and an almost entirely fresh body of men were elected to sit on the new. It was generally recognised that such violent changes were undesirable, and only in less degree was it felt that keen electioneering and the attitude of mind engendered by it were not necessarily conducive to the advance of architecture as an art. So the Institute had decided to alter the method of electing its Council. Instead of the whole body retiring every year, only one-third would do so, thereby ensuring on the whole a continuity of policy, but at the same time affording opportunity for a gradual yet complete change, should the Council endeavour to pursue a course opposed to the wishes of the general body. This was a reform as wholesome as it was simple.

A second important matter was the relation of their provincial members to the government of the Institute. He used the word "provincial" from the long habit and because their headquarters were—and always have b London. At its inception, the Institu almost entirely a London affair. It wa amusing, in the light of present circum to find with what effusion the first n from outside London's cab radius we comed. But things had altered. Or another, architectural societies in pr towns, large and small, had become alli them; so had societies overseas, and present time, it is no empty boast to s on their own members and those of the societies the sun never set. The nu members practising beyond the Lond outnumbered those within it by two It would, therefore, seem possible that, i of time, it would be perfectly natura necessary to make a distinction, to s their "metropolitan" members inst their "provincial" members as th now.

But whether this slight yet significant should mature or not, it had become ve that the well-being of the Institute now depended upon the goodwill of those n who practised outside London; and equally clear that by-laws which hinde latter from voting on important issu inimical to the welfare of the body co Accordingly a greater share of represent the Council had been given to the Allied S and not only to them, but, in accordan the democratic spirit of the age, to the ates. Nor did the change end there, fo sentation was now to be given to Licen one step among several which had bee towards improving the status of that

With regard to voting, take one instanc Hitherto a resolution of the general bod only be passed at a meeting held in Lon was not difficult to imagine the trouble pense entailed upon members living in th of Scotland, Wales or Ireland, if they f strained to come up and vote; or, in th native, their annoyance at sitting imp at home while, perhaps, vital issues the balance in London. This serious di had been remedied by the establishmen certain conditions, of a postal vote.

Another matter which might have far-r effects was the permission now given members of the Institute to designat selves "Chartered Architects." This wi —and a useful step—toward registrat it was not a substitute for it; for reg would apply to all qualified architects, members of a Society or not; whereas t nation "Chartered" could only a their own members. Nevertheless, Parliament, in its wisdom, should de grant registration, the public would be protected by the opportunity afforded employing a chartered architect.

These were the most important of the which chiefly affected them, inasmuch altered and strengthened their con But there was another matter of some which had affected their well-being du last year, and that was the matter of t premises. They would recollect that a they held their inaugural meeting, an of those that succeeded it, outside th Now, he was glad to say that, thanl skill of their honorary secretary, th able to meet in their own building and i in which it was easy to speak, even if i pleasure to hear. But—and here cam reservation—these premises were still perfect. Their library, which he belie the finest architectural library in th was not entirely safe from the risk o was inadequately housed, and its growth would before long compel the large its boundaries. The question w complicated to be dwelt upon now; it was, and it would have to be d He need hardly add that the Council alive to the great importance of th and that it was already taking steps to out of the difficulty.

Another important event which ha in close connection with the Institut International Congress on Architectur

first of its kind. Two years of syste- reparatory work were crowned with ccess. A large number of nations in and New World were represented by their most distinguished architects hers of architecture. The lectures and n on the past, present, and future of ural education were of first-rate im- , and the complete report, which was s of preparation, would be the hand- those concerned with architectural for years to come. The exhibitions of work not only filled their galleries onshire House and Grosvenor House and gave an unexampled bird's eye what was being done by the architects mmediate future all over the world. social side the Congress was at least fruitful. Personal intercourse and discussions greatly helped to create understanding and good feeling, and uet which ended the Congress with so husiasm was one of the most successful istory. Their Board of Architectural n, and the authorities of their archi- schools had now at their disposal ody of information and doctrine to y could devote their liveliest powers of

wed a great debt of gratitude to those rd work made this Congress a success; Curtis Green (the Chairman of the o Mr. Maurice Webb (the Chairman xecutive Committee of the Congress), ll others who gave time and trouble ted measure to helping them.

their own body, by far the most g event that affected them in the pro- of their art was the appointment of l Commission on Fine Art. This act, ire, had been welcomed not only by , but by all who had an enlightened the arts. But in this, as in all reforms, ns that were too sanguine would sow of their own disappointment.

uld not abolish bad design by a stroke , although they could help to restrain e terms of its appointment, the Com- as an advisory body which could only. hen put in motion by an outside power er was with the Government and with r quasi-public bodies, who could Commission's advice or opinion on onnected with the arts as they affected . This should not be difficult if the re one of real importance. This step en successfully taken, the facts of the mpanied by explanatory plans, draw- photographs, ought to be submitted to ission, which would consider them in l, if necessary, would visit the site and own inspection. The Commission en proffer its advice, which would carry great weight, although it need epted under compulsion. The public, if members of it were sufficiently l no longer stand by in impotence ie outrage on good taste was per-

the Government could always avail ie Commission's advice in any public mportant lay-out. But it must be mind that the Commission had no of its own, it could only deal with brought before it; and, supposing umber of sow's ears submitted to it, power to turn them into silk purses. n the nature of things, be largely con- h architectural matters, but of this rest assured, that it would not usurp ns of the practising architect; it would not, for instance, take on the assessorship of important architectural competitions, and this, less because such a course would unduly encroach upon the work of architects, than because the Commission would be unfitted to cope with the thousand and one details inherent in the assessing of a competition.

The withholding of compulsory powers from it, at any rate in its early life, was a wise limitation, but it would nevertheless exert a powerful influence in the formation of a sound public taste. Its preliminary steps must be taken with discretion, but it had before it, he was convinced, a fruitful and beneficent future.

One final reference to events of the last year and his survey of the past was done. They had never had a more delightful Conference than that which was held at Oxford in July. The attendance was never so large, the hospitality was never more cordial, the *locale* was never more attractive. To their provincial members, in particular, was the appeal strong. To see Oxford from within, to have the run of those ancient and beautiful homes of learning, was to most of the company a new and stirring experience, and behind all this moving of the spirit there was a soothing sense of peace appropriate to the atmosphere of leisured learning. The reception accorded by the municipal authorities and the University was flattering in the extreme, and no one who was present would ever forget that last and dignified banquet in the great Hall of Christ Church.

It was gratifying to know that the esteem in which representatives of the Institute were held by the authorities at Oxford was shared in an increasing degree by authorities of other kinds, and by citizens at large. Never had their help in important questions relating to architecture and building been more freely sought, and never had the applications for the appointment of arbitrators in building disputes been so numerous. It was recognised that the help afforded by the Institute was both wise and disinterested.

So much for the past; into the future he would not attempt to penetrate, but this they must all freely recognise—that the great controversy of the last few years having been at length settled, they could now devote their unfettered energies to matters which came home to their business and bosoms, questions connected with their practice, questions of science, questions of literature, and, above all, they could devote them to the untiring pursuit of their noble art.

The Vote of Thanks.

The Earl of Crawford, in moving a vote of thanks to the President, said the inaugural address had been in effect a review of a session which had been both remarkable and memorable, apart from the achievement of the unification of the art of the profession, or, as they might choose to call it, the unification of architects. The controversy had had to do with all classes, and it was good for the outer public to know that at length unity of outlook had been achieved by those on whom they were singularly dependant. He was sure he would not go too far in saying that architecture itself would not suffer from finding itself in the future less concerned with its domestic and internal organisation. He did not, however, think the Institute was justified in counting on the Registration Act passing into law for several years, although it might, of course, come immediately. It had been found that Bills which commanded universal sympathy from the professional and public interests concerned often took several years of Parliamentary life to come into operation. In reference to the Commission of Fine Arts, he was extremely glad the President did not take up the line of optimism—optimism was entirely out of place. There had to be twenty years of hard work before it was permissible to mention optimism with regard to the British outlook on art. The Commission was purely an advisory or consultative body, bereft of overriding or compulsory powers. It was based on the model which had now achieved security in the U.S.A. Although it would be many years before the English Commission reached a similar status, there was scope for good work here, and, as it became better known, more opportunities for usefulness.

It had been a memorable year in the history of British architecture, and he thought the success was largely owing to the sagacity, foresight, and shrewdness of the President, with the help and support of a committee working hard and strenuously for the welfare of the Institute, the promotion of its art, and the advantage of its *clientele*.

The vote of thanks was seconded by Lord Charnwood, and carried with acclamation.

The President briefly replied.

Presentation of the Street Architecture Medal.

In rising to present to Mr. Francis T. Verity, F.R.I.B.A., the R.I.B.A. Medal and Diploma, for the Best London Street Frontage in 1923, the President said, in presenting the medal to Mr. Verity, he was sure they would all admire the simplicity, soberness and dignity of the building, (Shepherd's Bush Pavilion) particularly with regard to the purposes for which it was intended.

Mr. Verity said the honour had given him fresh heart and energy. It was an appreciation of an honest endeavour to achieve something, and a sympathetic understanding of the difficulties which had to be overcome in the erection of the building, that gave the award such a special significance. There were very real difficulties by reason of the locality in which the building was placed. The practicability and absolute fitness for the purpose for which it was erected, with the minimum of expenditure, was the main idea. Faced with this definite economic problem—the greatest problem which faced many of them to-day—there grew a vision of a splendid simplicity and beauty of brickwork as seen in the early Roman work. Ideal brickwork had always had a fascination for him even during his student days; the Roman Thermæ especially had been a continual inspiration to him during the design of the building. The economic view-point would, perhaps, be of value to their younger men, showing how difficulties could be overcome by work and thought, and be the road to such an award as he had received this year.

Office Buildings.

This drawing was hung in the Royal Academy Exhibition this summer. It shows the elevation of a projected scheme for a large block of offices in London. There is a right-of-way through the centre of the site to a courtyard within, which dictated the arched treatment in the centre of the building. The elevation is the direct outcome of the plan. The architects are Messrs. Oswald P. Milne & Paul Phipps FF.R.I.B.A., of London.

Anningsley Park.

This house has been built at Ottershaw on the site of an early eighteenth-century residence which had been badly added to and mutilated at a later date. With the exception of a small wing, the old building had to be completely demolished, the new building being erected with the old materials.

The accommodation comprises a large open hall, with minstrel gallery, dining room, living room, study, kitchen, servants' hall, pantries, &c., on the ground floor; and 11 bedrooms, 3 bathrooms, &c., on the first floor. Messrs. W. H. Gaze & Sons, Ltd., were the contractors and were also responsible for the electric light installation; Messrs. George Wragge, Ltd., for the iron casements; and Messrs. Rosser & Russell for the heating system and the domestic hot-water supply.

Mr. Gerald Warren, F.S.Arch., 12, Norfolk-street, Strand, W.C. 2, is the architect.

Shops and Flats, The Quadrant, Hendon.

These premises are situated in the heart of the area opened up by the tube railway extension to Edgware.

The block is planned as a group of twenty shops, each having a small flat on the first floor and a larger "two-story flat" above. At present only twelve shops have been erected The frontage, in addition to being in part a quadrant embracing five of the shops, rises continuously from one end to the other, dictated an elevation of the varied or picturesque variety. The most prominent portion—the actual curve—is devoted to a series of brick piers, filled in with segmental bays, surmounted by a simple roof and flanked right and left by single shops having a contrasting treatment, consisting in each case of a large gabled treatment finished in "Atlas White."

To the right of the actual quadrant, the straight run of six shops fronting Finchley-lane is of a simple pseudo-Georgian nature, but broken in the centre by another single white front with Dutch gable and oriel window, introduced both as a feature and in order to mask the stepping of roofs necessitated by the sloping ground.

Internally, each shop is left as unobstructed as possible; the first flight of the staircase is lighted from below by a fanlight over the entrance, and from above by means of a window at second floor level. The first floor flat consists mainly of four rooms, and has rear balcony served by a trade-hoist continued to a similar balcony on the floor above. The upper dwelling has six or seven rooms, according to position.

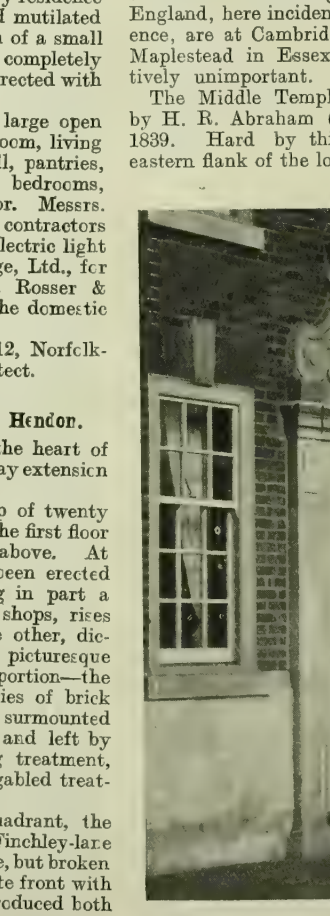
The main elevations are in Dorking and red rubbed bricks, with "Atlas White" rendering and stucco. Constructional steelwork, The Aston Construction Co., Ltd.; metal casements, C. E. Welstead, Ltd. The whole of the buildings were erected by John Laing & Son, Ltd., of Lincoln House, Holborn, whose "ferro-brick" system of fireproof construction was used for the first and second floors. The designs were prepared by Messrs. Ewart G. Culpin & R. S. Bowers, in association with Mr. F. W. Chas. Barker, engineer and surveyor.

MODERN BUILDINGS IN THE TEMPLE

THE Stuart period terminated Mr. J. Bruce Williamson's accomplished narrative concerning the congeries of the Temple Courts, Gardens, and Buildings, so the last architect mentioned in his capital book (reviewed on page 729) is Sir Christopher Wren, the designer of the great Gatehouse in Fleet-street, the Cloisters adjoining Pump-court, and the house built for the Master of the Temple on the site of the old clergy residence destroyed by the Great Fire of London. It will, therefore, be interesting to mention the names of some of the architects who, during the last century, have left their mark more or less within the precincts of the famous Crusaders' church built by the order of the Templars. The lawyers, during many a year after they came into possession, used to await their clients in its round nave just as the old serjeants-at-law did in the nave of St. Paul's Cathedral. The other remaining circular churches in England, here incidentally alluded to for reference, are at Cambridge, Northampton, and at Maplestead in Essex. These are comparatively unimportant.

The Middle Temple Library was designed by H. R. Abraham (1773-1850), and built in 1839. Hard by this Library, and on the eastern flank of the lower gardens, Edward M. Barry, R.A. (1830-1880), carried Frenchified and somewhat florid chat pile of chambers at the bottom of Temple-lane, opposite where the Temple stairs once stood. The marking the approach to the from the Thames Embankment is m creased in importance by the round towers set at the corners of the comp Their outline can scarcely be called a

By way of contrast the less ambitio of chambers overlooking the same from the west, and built of red brick turesquely situate on a terrace endin and left by flights of steps leading do the Fountain Court to the river. J. Aubyn (1815-1901), who had offices Lamb Building for many years, architect, and a capable artist. Arthu (1828-1901) was responsible for the row of "Dr. Johnson's Buildings" d nondescript style and occupying t whereon the great lexicographer at o rented rooms, hence the designation.



Sidney Smirke rebuilt the Inner Hall in a manner seemingly based upo Gothic, but presenting a miserably m terior carried out to some extent on foundations. Princess Louise open premises in 1870.

NOTTINGHAM HOUSING SCHEMES

Up to the end of 1922 a total of 1,470 houses had been built by the Nottingham Corporation under the Housing Act of 1919, some of which were illustrated in our issue for February 17, 1922. The houses illustrated on p. 723 have been built on the Highbury-road, Bulwell estate, to the design of Mr. T. C. Howitt, A.R.I.B.A., Housing Architect and Surveyor to the Corporation, and were built by Mr. F. W. Horton, of Lincoln. The houses are of the parlour type. These illustrations are from a brochure which the Nottingham Town Council has issued dealing with its housing activities.

We give on this page the lay-out plan and two views of houses built on the Stockhill-lane site by the Nottingham Corporation to the design of Mr. William R. Gleave, A.R.I.B.A., of Nottingham.

By W. R. LETHABY.

SCULPTURE AND COLOURING.—I.

STER JOHN OF ST. ALBANS, SCULPTOR.

l story of the sculptures of the struc-he tombs would fill a book. I can here ss a few selected points. Two tall epresenting the Annunciation above loor of the Chapter-house, have already

Fig. 1.—Chapter House.

ribed. They are certainly to be num-ong the most impressive statues in casts at South Kensington can most tudied. The Chapter-house was being in 1253, and in the accounts for that images, costing 53s. 4d. (four marks),

are mentioned. As Professor Prior suggested, these images may have been the Annunciation group, and this is made the more likely by the evidence that the big figure of the Majesty now between them did not exist originally. Four marks seems a small price for the two figures, but it would be for labour only. The images of the Queen on the Waltham Cross cost five marks each nearly fifty years later (Fig. 1).

In 1257-8, John of St. Albans, "sculptor of the King's images," received a robe of office while working at Westminster along with Peter of Hispania, the King's painter, and Alexander, the King's carpenter, who, as we know from other records, were engaged on the Abbey works. John of St. Albans, the King's sculptor, was thus employed at the Abbey at the very time when the first work of the King was being completed. The Angel spandrels, high up in the transept ends, can have been carved only a very short time before, if, indeed, they were completed. As the most important sculptures now in the church, they may with confidence be attributed to Master John and his school of assistants, but of course the chief task of "the sculptor of the King's images" would be the wonderful northern portals, the work on which must have continued for many years. A measured drawing of the angels in the south transept, made by my old friend, J. A. Slater, in 1883, is reproduced in Figs. 2 and 3.

I have examined the angels from a scaffolding, and there are casts of two of them at South Kensington; they are certainly of great beauty,

Fig. 4.

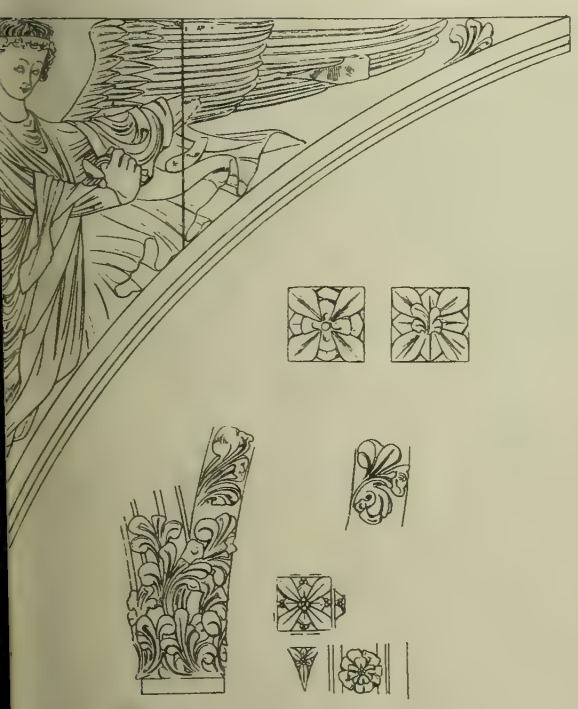

Fig. 2.—South Transept.

Fig. 3.—South Transept.

FIG. 5.

serious and yet gay, the very embodiment of rapture. Fig. 4 is a distant impression of one of the heads.

The style of the sculptor of the Chapter-house Annunication may, I think, be detected in these censing angels. Notice especially the hand of the more eastward of the two in the south transept, which is sharply turned at the wrist; the little lion under the foot of the same angel resembles the lions of the Chapter-house capital; compare also the clumsy feet and the drapery of the figures. The chief sculptor could not have done all the figure work in the church, but he would have guided the whole, and as chief of a school it would have been his in the sense that the sculptures of the Parthenon are by Pheidias. One master seems to have worked on the Annunciation and the Censing Angels.

Between the two angels in the north transept were two figures which are lost. Opposite, in the south transept, two still remain, which seem to have reference to the story of the Confessor's ring. Possibly the first pair showed the gift of the ring, and the second its return; both incidents appeared on the tapestry of Abbot Barking.

With these angels of the transepts must be associated some in the smaller spandrels of the wall arcade. One of these in a south-east chapel has an angel carrying two crowns; another now in the Museum, probably from the same chapel, plays a harp (Fig. 5); yet another in the west aisle of the north transept swings a censer (Fig. 6). These, taken together with the bigger angels, so closely resemble the angels in the spandrels of the wall-arcade of the Ste. Chapelle (see Viollet le Duc's "Ange," Figs. 4 and 8), that it seems that one series must have been suggested by the other.

These noble figures of angels have a marked affinity with another chief work of thirteenth-century English sculpture—a series of angels at Lincoln Cathedral, which was carved some 15 or 20 years later than the Westminster figures. They are in the Choir, which is often in consequence called the Angel Choir, but the sculptures themselves represent "a choir of angels." Some play musical instruments, others

FIG. 7.

guide the sun and moon and do all the things that angels should. These Lincoln angels, with the wonderful sculptures of the Judgment Door, which is contemporary with the Angel Choir, are so like the Westminster angels and the old north portal that it seems likely that the Westminster sculptors must have gone on to Lincoln.

At the Abbey there still exists a Choir of Angels, but it is in a position where it can hardly ever be seen, on the soffits of the six window lights above the interior of the great north door.

In July, 1911, I examined these medallions from the high Coronation stand erected in the north transept. They are on the soffit lower range of windows, and there are four, two on each side of every arch. the medallions are circular, but some a squares (Fig. 7); the frames touch one and in some cases throw off foliage in t drel spaces. The figures or rather bust sent a Choir of Angels, playing music, ping, carrying chalice, censer, incen crown, palm, scroll, book, &c. One bea (sun and moon ?) and another a dia musical instruments are harp, dulcime and bells. They are in fair condition great beauty; the casts that were obta Cottingham about a century since seem been excessively touched up. When tunity offers they and all the sculpture be photographed. These sculptures in lions, touching one another, confirm t that the medallions in the north porch tained sculpture. The lobed squares are of the form assigned to the central the great porch. Below the Choir of An the extreme window jambs, are two s figures of kings, one of which stands on prostrate figure. This is probably th fessor and the other Henry III (see Ne also Walpole's "Anecdotes of Painting, trated edition).

Another interesting group of sculpture Abbey is formed by the portrait heads, t special study should be devoted. It is that we possess no standard set of Roy traits, and I should like to suggest the to any student who wants an interesti Directly inside the Royal door at West is an altogether remarkable head (Fig. rather a dark place, it is hardly ever ob but it is carved in marble and has e injury, so that it is practically perfect. It beardless man crowned, and it must fr special character and place represent Her himself. It is recognised in France that p heads of Henry's contemporary, St. Louis and the earlier representations of Henry him as beardless. drels of the wall arcade are filled figure sculpture, foliage (naturalistic ental), or with diaper work. The St. Paul's, or the north-east chapel, sculptures of which a pretty group hind a tomb which looks like the f the Virgin. One of the chapels h side, as we saw, seems to have

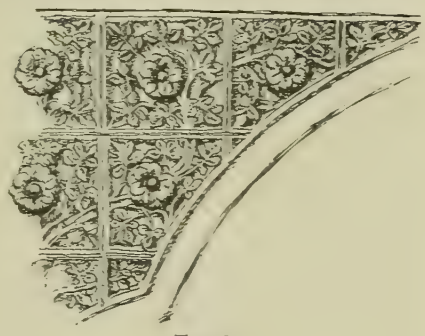
Fig. 12.

had a choir of angels; the alternate chapels on this side have diaper spandrels. Of the spandrels carved with foliage a delightful one with birds amongst it is illustrated in *Gleanings*. At the Abbey is a drawing made nearly a century ago of the branching rose spandrel in the Chapter House (Fig. 13). The idea of



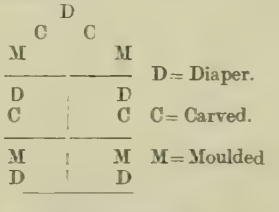


Fig. 13.

systematic variation is carried out in the triforium arches of the Presbytery which are decorated thus :—

D = Diaper.
C = Carved.
M = Moulded

With the spandrel sculpture must be mentioned the magnificent set of heraldic shields in the aisle arcades of the Choir. Amongst these are the arms of England, France and Germany. Of the last there has been question whether it was double-headed, but examining it in a good light, I found enough to show that the head was single; there is a turn of the neck which brought the head in profile (Fig. 14). This suggests a comment; a practice is springing up, following some old examples, of making heraldic charges face to the east in every case, but it was not so here, as may be seen also by the ramping lion of Simon de Montfort near by. The eagle of the German Empire in the

Fig. 14.

early stained glass was single-headed, and so it seems to have been on Crouchback's tomb. Matthew of Paris gives the eagle of the empire either with one or two heads. A shield on the south side, which has long been attributed to Rothsay, has recently been shown as that of De Ros.

The vaulting bosses of the west aisles of the Transepts are big, bold sculptures, about 2½ ft. in diameter, and in high relief. The one nearest the north front is David playing his harp; the next has two men who have been called Aaron and Moses, and a cast of this at South Kensington shows that Moses has horns; another has the Virgin and Child with angels on either hand, and others seem to be the Assumption of the Virgin and "Abraham's bosom." These are fine work, as may be seen by casts of four of them at South Kensington. Fig. 15 is from a delightful little seated Virgin at the top of the sculptured jamb of the Chapter House door; there is a companion figure of Christ.

Fig. 15.

Royal Portrait Statues.—Passing from the structure to the tombs we find a series of figures of great beauty, some of which are of bronze. First must be mentioned the noble bronze effigy of Henry III, the work of William Torel, goldsmith, of London. It formerly had a canopy, lions at the feet, and sceptres in the hands which are now lost, but the figure is practically perfect. The effigy of Queen Eleanor by the same artist is of unsurpassable freshness and grace; her hand holds the neck band of her mantle, and the body bends in a slight curve from head to feet. A figure of the Queen on her seal which was probably made several years before her death, resembles the effigy in many respects and was probably by the same goldsmith. Were it not for this we might suppose that the effigy had been modelled by the sculptor of the stone statues of the crosses. Rather we must think that the seal was referred to by the sculptor as well as by the goldsmith maker of the effigy.

I cannot think why this most lovely portrait of such a romantic person as Eleanor of Castile has not attracted somebody to write her life. If it were well done it might suggest the spirit of the Middle Ages in England almost more than anything else.*

The question how far the Royal and other important effigies are likenesses will be important whenever an attempt is made to form a series

* In the Wardrobe Accounts of Edward I are many delightful details of jewels, plate, and furnishings, which would adorn such a story. Begin with the *Dict. Nat. Biog.* and Agnes Strickland.

of early national portraits. In such a critical book as Sir J. H. Ramsay's *Daun of the Constitution* (1907), it is again asserted that tomb statues are not portraits. He says: "It would seem that the bronze effigy of Henry III executed about 1291, was not intended for a likeness, but only as an ideal of the stately and the beautiful. So J. H. Middleton, *Academy*, March 5, 1881." In this case the King had been dead nearly twenty years, and so there would have been special difficulties, but to say that a likeness was not intended seems against both reason and record. In the account for the making of the bronze figure by William Torel it is said to be *ad similitudinem Regis*. The orders of Henry III for images representing himself while alive are worded in what may seem to us a vague manner, but that must have been a custom. Thus a picture was ordered which was to have St. Edward presenting a certain King to the (Divine) Majesty. There may very well have been folklore reasons against too close identification while the person represented was living, but these could not hold when he was dead.

Doubtless tomb effigies for country churches were often done under conditions which would not allow of strict portraiture, but with Royal persons the circumstances were different. Their dead bodies were embalmed and were carried open at their funerals. At a later time the actual body was represented by an effigy made up like a waxwork, and it lay long "in state." The tomb statue was a more permanent representation of the body or of the funeral effigy, and was fully coloured even to the eyes, cheeks and lips. It was a "double" of the dead person. The custom persisted fully till the time of Elizabeth. Stow writes: "The city of Westminster was surcharged with all sorts of people who came to see the obsequies, and when they beheld her statue or effigy lying on the coffin, set forth in royal robes, having a crown upon the head and a ball and sceptre in either hand there was such a sighing, groaning and weeping as the like hath not been known." Miss Agnes Strickland adds that the effigy was the faded waxwork, which still exists. For embalming from the time of the Conquest, see Sandford.

It is recorded that Queen Eleanor was embalmed, and that Henry III was also is shown by the fact that his heart was given to Fontevrault. "The King of France died and was embalmed, and buried as befitted so great a prince" ("Jehan de Paris," French Romance). Such a custom made continuity of record easy. The statues of Queen Eleanor at Waltham and Northampton are very similar to the effigy; all agree in having freely flowing hair, and the same is found on her seal. This must certainly be an individual trait.

Master Alexander of Abingdon, the Imagour.

We have found that Robert of Beverley was occupying the office of King's mason in 1284. Master Richard of Crundale, "cementarius," was in charge of the Royal works at Westminster Palace in 1288, and he doubtless directly succeeded Master Robert. He may have had his name from Crundal, in Hampshire. Queen Eleanor died in 1290, and Edward at once set about building the series of memorials now known as Eleanor Crosses and tombs in the Abbey, at the Blackfriars, and in Lincoln Cathedral. The Abbey tomb and Charing Cross were the work of Richard Crundale, the King's mason, who, however, died about 1292, before Charing Cross was completed. The full original accounts for these works still exist, and it thus appears that the statues of this cross, as well as those which most fortunately still exist about the Waltham Cross, were sculptured by Master Alexander of Abingdon, "*le Imagi*nator." (These most beautiful works of such historical importance are all the time decaying in our acid atmosphere, and little as I like meddling, I think it might be wise to remove the best preserved figure from this and the Northampton Cross, and substitute a copy. I should like to ask the S.P.A.B. to consider this.)

Edmund Crouchback, the King's brother, died in 1296, just as the crosses were completed, and there can be little doubt that his superb tomb in the Abbey must be Alexander's work. Alexander is mentioned several times in the "Letter Books" of the City of London. In 1305, Alexander "*le Imagour*" acknowledged a debt of £6 to a merchant of "Besaz." This is repeated two other times ("Letter Book" B). In 1312, Master Adam the painter, and others, were sureties for Master Alexander "*le Imagour*" that he would complete his contract with the parson of Stanwell before All Saints' Day ("Letter Book" D). Adam the painter is mentioned again in 1313 ("Letter Book" E). We thus have a period of over twenty years of Alexander's working life marked out—1290-1312. The persistent calling of him "*le Imagour*" ("*Imogour*" was a not infrequent craft title), seems to point to some office or special reputation, and his work on the most important of the Queen's crosses conjointly with the King's mason, indicates that he was the King's sculptor. He was certainly the most important sculptor of his time. The entries in the "Letter Books" show that he was a citizen of London—and they suggest that he had what is sometimes called the artistic temperament; even his name was romantic.

The effigy is that of a very perfect Knight. Crouchback was not taken to the Abbey until 1299–1300, but his tomb was probably erected together with that of his wife Aveline (who died as early as 1273), about 1290. The graceful tomb statue of Aveline is in style remarkably like the figures of Eleanor on the Crosses, and there is every probability that it was by the same master.

Another effigy of a lady, at Chichester, is so akin to the Aveline statue that both should be by the same artist. Professor Prior says of this: "The effigy of Lady FitzAlan, who died c. 1280, shows a handling some way towards that of the Westminster lady." He observes also a resemblance between the weepers of both tombs, which "do not turn sideways as in the St. Denis model." While writing this I have re-examined the figure at Chichester, and noted the following points: The axis of the body bends in a slight curve from head to feet; the drapery falls in long lines from the shoulders and covers well the feet, which rest against two dogs; the mantle is caught up under each elbow; hands are palm to palm on the breast; linen around the head and chin leaves only a triangular opening for face; she has also a veil over the head, which falls on the shoulders; the head rests on two square pillows, the upper smaller one being placed diagonally; two angels at the head are rather big and have their hands on the upper pillow; in profile the figure forms a long low curve terminated by head and feet. The two figures are so much alike that one is practically a repetition—that at Westminster seems a little more developed, elegant, and later; I do not doubt that both are by the same sculptor.

Professor Prior compares another lady's effigy in Aldworth Church, Berkshire, with the Waltham queens and Aveline. "These ladies would seem executed c. 1280-1300, and are sufficiently alike to suggest their source from a special *atelier*. Is it possible that they show the style of a single artist?"

The weepers of the tombs of Aveline and Crouchback are also of one style with the queens of the Waltham Cross. Among these weepers are queens and princesses, which are practically reduced copies of the Queen's statues. (See for these Fig. 395 in Prior and Gardener's "Sculpture.") There is the same swaying attitude, the drapery caught up by the arm, the hands on the mantle strap; above all, there is the same expression of sweetness and dignity. The weepers of Aveline's tomb are much injured, and those of Crouchback's tomb have been defaced (literally), so that at first sight the little figures have a rather blunt look. Recently, however, they have been cleaned, and this, revealing the sharpness and delicacy of the modelling and the perfect measured grace of the poses and proportions, as well as the colouring, even to the flushed cheeks, shows that t master works. I should like to see casts set up in a museum.

The tombs of Aymer de Valence and Eltham also have weepers—there must than sixty of these figures altogeth weepers about the tomb of Aymer are s elegant, so that at first sight one is in prefer them to those of Crouchback The weepers of John of Eltham's tomb affectedly jaunty, but very gay and a fortunately, twelve of them still keep the —as they never did when alive! A little the series shows that there must have be cline of manners between 1290 and 13 high time of Edward I and after the Edward II. The weepers of the tomb of like the whole work, follow the traditio Crouchback tomb, but they can hardl the same master—rather by a pupil. T of John of Eltham must, I think, be by t master who wrought the monum Edward II in Gloucester Cathedral.

Later Sculptures.—The tomb of Philippa is a new departure in portraitu has suffered much violence; even the h been at some time broken off, but it is a able work of art. The figure is realised the drapery; even the pillow is not fo is the portrait of a pillow. The quee hand held her mantle strap, which was cut"; the right hand fell lower and sceptre; an iron pin which projects fr head must have supported its higher en hair was arranged in an elaborate net s with little pins, to which precious st gold beads must have been attached. S shows a crown still existing. The ca astonishingly delicate; the small tracery were set with deep blue glass, which rem places. Traceried margins on each side figure contained little figures, now lost. an account of the tomb in the Liber N appears that these were kings—probab Saint Kings of England. Two of the w remain (hidden by Henry V's chantry these still show remnants of "picking gold and colour." This tomb was by H of Liège.

The sculpture of the reredos of the C of Henry V (the Chapel of the Annunc has recently been cleaned, and this has b out in a remarkable way their exce quality. In the middle is an empty niche I suppose, occupied by a crowned figure Virgin. On either hand is the Virgin a announcing angel. Beyond are Edwa Confessor and Edmund, King and M while at the extreme left and right are the of England and France, St. George and St. These life-size figures are framed up in nacle work, containing a multitude of figures of prophets. The large heads are expression, human and pathetic; the h St. Denis, carried in his hands, is plac beautiful, yet so true that it might hav studied from a corpse. The head of the is that of a frank English girl, with h thrown back in a natural modern way (F These heads show close observation of o living types; they are not traditional c tions. The tomb effigies of Abbot Col and Philippa, Duchess of York, have son of the same character which was clearly of early fifteenth-century sculpture.

When I described these sculptures b thought that the central niche would hav occupied by Christ in Majesty, but fr prophets in the tabernacle work the g Virgin is more probable. I suggested al (*a*) two important figures on the staire the Confessor and the pilgrim; (*b*) th kings above in the middle who hold cl are Sebert and Henry III, or the latt Henry V himself as builder of the nave; bishops or abbots, SS. Wulsin and D The identification (*a*) is certain, for, see above, it is clear that the king's head is receive a metal crown, and the other fig a pilgrim's hat. The pairs (*b*) and (*c*) are less like the Confessor, *founders*. A g "founders" appeared on some thi

tapestry which once hung in the Choir, paintings on the sedilia comprised the or and the pilgrim, two other kings and lesiastics. We are justified, therefore, king of the statues on the front of the as a group of Founders of the Church. e big hollow of a table moulding below in sculptures are three pretty little n trefoils formed by a ribbon (compare efs on the screen of the High Altar).

To be continued.)

THE HISTORIC BUILDINGS OF THE TEMPLE, LONDON

Mr. J. Bruce Williamson, of the Middle Temple, has compactly compiled a vast amount of varied and most interesting information in one handy volume* and based his consecutive narrative on the original records possessed by the learned and honourable societies of the Temple. These first-hand extracts include particulars concerning the legal history of both of the eminently illustrious bodies originating from the institution of the Order of the Knights Templars down to the end of the Stuarts. The chronicle is thus limited by the absence of further records. The scope, however, of this standard epitome is extensive and furnishes many illustrations of the times and manners of differing periods and also circumstances of administration incidental to the altered governing authorities. There is much that is humanly attractive among these documents besides pertinent quotations about building projects and contracts having reference during centuries to the Temple Church and its great Halls, also the Benchers' Chambers and the entrance gates from the days of the Crusaders to the reign of Queen Anne.

The origin and continued right of sanctuary naturally comes under review, and not a few amusing incidents are described in consequence of the independence of the Temple authorities from interference by the Lord Mayor and City Fathers, who naturally regarded with a jealous eye the privileged status enjoyed within the precincts of the Temple and its adjoining mediæval suburb extending from Blackfriars on the east towards the Savoy and Charing Cross. Blackfriars Priory stood within the City walls along the bank of the Flete Ditch. On its other side, beyond the rear of the Palace of Bridewell, and from St. Bride's Churchyard monks and crusaders as well as parochial clergy possessed acres of land skirting the Thames and extending mostly nearly to Fleet-street. The Bishop of St. Davids' property stood at the corner of what is now known as Ludgate-circus, directly facing St. Paul's Cathedral, seen from thence over Lud Gate at the foot of the hill and fronting the bridge spanning the Fleet River on its way from the shambles of Farringdon to the Thames, its outfall being near where Blackfriars Bridge stands. The Bishop of Salisbury's house and his adjoining manor so charmingly open and rural, had its own landing stage on the south. The property extended up to the great Priory of Whitefriars, whose famous collegiate church and Carmelite buildings were demolished at the Reformation. Out of their ruins favoured retainers of the Tudor king built themselves houses, which in their turn soon became degraded and made way for the notorious "Alsatia," the protected rendezvous for rogues and vagabonds housed beyond the Lord Mayor's jurisdiction. Some modification of this evil happened in 1697, when the right of sanctuary in "Alsatia" came to an end. Serjeants' Inn, with some frontage in Fleet-street, was contiguous to Whitefriars, and formed the easternmost outwork of the Temple. Their westernmost extent is not so easily defined, but the property there abutted on to the Bishop of Exeter's Inn and garden stretching south from Temple Bar and facing the Strand. The river frontage of Essex House Estate probably was set back alongside the Temple Lower Gardens, judging from the position of the Watergate still standing at the bottom of Essex-street. This mansion occupied the site of Walter de Stapledon's episcopal residence, which was built on the extremity of the Temple environs. Near the gate house at the top of Temple-lane, which ended at the river landing stage famous as Temple Stairs, was an ancient friary. When Child's Bank was rebuilt in 1879 the last house on the west side of Temple-lane had to be underpinned, and in doing this the bodies of several friars laid in a row had their legs protruding into the excavation under the porter's lodge. In order to build the new wall these obstructions, of course, had to be removed.

The sole means of access from Fleet-street to the Temple was at this point, and the absence of

*"The History of the Temple, London." By J. Bruce Williamson. With eight illustrations. (London: John Murray, Albemarle-street). 1924. Price, 21s. nett. Cloth, gilt.

From "The History of the Temple."

Middle Temple Hall, Court, Fountain and Railings erected in 1715.

any other frontage thereto from this mediæval suburb arose from the fact that the Thames furnished the great highway from the City to Westminster, while Fleet-street, little larger than a suburban lane, continued to be of little importance because Holborn, long known as "The King's Street," was the main thoroughfare from the West into London through Newgate, which stood near "the old stoccene of St. Andrew's Church," where the bridge stood ages before the Victorian Viaduct was dreamed possible.

This brief topographical summary furnishes an outline survey giving the environment of the Temple and demonstrating its geographic importance. Originally the Knights Templars founded their quarters near the top end of modern Chancery-lane, on the upper side of Holborn in the parish of St. Andrews. There they built a round church in Caen stone planned on the lines of the Church of the Holy Sepulchre at Jerusalem. It became known as "The Old Temple," and was sold about 1155 to Bishop Robert de Chesney of Lincoln. The Templars also acquired land on the north side of Fleet-street, in addition to their fine estate on its south. The smaller holding was near old St. Dunstan's and the Hospitallers purchased that with its forges in 1485. The Knights of the Order of Jerusalem, as warrior monks, were the head of the preceptory in London controlling the establishments in Scotland and Ireland, consequently no expense or labour was spared to strengthen their position. They took over the hides of Wideflete from the monks of Bermondsey on the south side of the Thames. The Order became the chief bankers of Christendom in the thirteenth century, sharing that distinction with the Jews. After the abolition of the Knights Templars by Pope Clement V, at the instance of the French King, Philip IV, they remained the custodians of the Revenues and Bankers to the English Monarchs. An early entry as to this is mentioned under the date of 1274, when King Edward 1st began to reign. The lawyers prospered accordingly. Their beautiful circular church standing in The Temple was consecrated in 1185, the year of its completion, and therefore is exactly contemporary with Canterbury Cathedral. The choir was added half a century later and consecrated in 1240. This extension has suffered much from bad restorations as well as from mutilations periodically. It is still reckoned the most perfect specimen in England of this graceful form of construction, vaulted throughout upon pillars of equal height and in general idea has been compared as a magnified transcript of the Lady Chapel at St. Saviour's. Up to the time of the seizure of the Temple estates by Henry VIII, the maintenance of the church was carried out by the order of St. John of Jerusalem. Subsequently the charge for repairs passed to the Crown. The two societies of the Temple in 1607 took over this liability by doing the work in a somewhat niggardly way. The entries quoted show this plainly, neglect and indifference prevailing. In 1682 Sir Christopher Wren was called in by the Benchers of both Inns. Great ideals were contemplated and amends promised.

A new organ had long been the cause of much disputation, and the scheme of beautification now decided on included its provision. Consequently, the organ became the predominant feature af Wren's enterprise. He entirely remodelled the screen between the "round" and the choir, filling in both the side arches with plaster blockings, which were entirely "concealed in a cunning manner." The central arch was also closed up by the organ and the view from the Nave or Circular Walk was completely lost. The choir walls up to the level of the windows were wainscotted. The floor level was heightened, and shortened the visible length of the Purbeck marble shafts by hiding their bases, and altered badly the proportions of the building. Plaster and whitewash prevailed, both in the circular nave and choir. The altar was removed from the middle of the choir and placed permanently under the central east window, where above and behind the table Wren set up a reredos of wood adorned with four pilasters and two columns, with an entablature of the Corinthian order set off by cherubims, festoons, fruit, and flowers. A pulpit, with a sounding board suspended above it, was located some way down the central aisle and enriched by classic carvings similar to those of the organ loft and screen. "A compass pediment and also the Queen's arms freely carved: the intercolumns are large pannels in carved frames, and near the pediment of the altar screen is an enrichment with cherubims and figure of a Pegasus, the badge of the Society of the Inner Temple." The Holy Lamb, the badge of the Middle Temple, is on the other side, "for though these 2 Houses have but 1 church, yet they seldom sit promiscuously there, but the Inner Temple on the s. side and the Gentlemen of the Middle Temple Nd. from the middle Ile." "Fortunately," adds Mr. Williamson, "the whole of Wren's work has been swept away." The story of the organ continued a serious business, often very amusing. Judge Jeffreys, as Lord Chancellor, settled the dispute in favour of Bernhardt Schmidt, who constructed the organ of Magdalen College, Oxford. His rival, Harris, favoured by the Inner Temple, was ousted in 1687 accordingly, and "Father Smith's" organ is still in use.

The first reference to the undertaking of building the New Hall of the Middle Temple is an order dated 1562, with regard to its actual completion. All the members had to contribute, but the silence of the Minutes is inexplicable. The Hall is described by Master Worsley as "a spatious beautifull and stately room, and may vie with any of the like nature in the Kingdom." It is 100 ft. long, including the passage at the east end behind the screen, and 40 ft. wide. the height being 45 ft., lighted by six windows and covered by a splendid hammer beam roof, just recently under considerable repair. There is no record to show who designed the very handsome screen, or by whom it was executed. The work is said to bear a close resemblance to the great screen at Audley End. The exterior of the Hall has been so altered from time to time, especially the entrance, that the structure has suffered artistically. The present tower dates from 1832. Inigo J elected a member of the Inn on Febr 1612, in recognition of his artistic t designing the scenic effects and dec in connection with the Temple Masque were famous and frequently performe difficulty of lighting King's Bench W various courts is mentioned in the acc the Inn, such as that about 1700 as to Richard Cole, who discovered "a extraordinary way of invention of glasses in conicall figures and lamps to himselfe." Candles were employe the buildings. The Inner Temple taken down (1868-70), as it had lo trace and vestige of antiquity

Most of the various chambers were enterprising venturers, and the Socie resolving to stop speculations of t often got into disputes, foreclosed and money to finish such contracts. Dr. plan, approved by the Middle Templ erection of chambers over the cloister on one side when Sir Christopher W mitted a competitive alternative. Lo cellor Henage Finch acted as refere 1680 made this award, "That the said shd be built 70 ffeet long and 30 ffe from out to out, and 3 stories high cloyster according to the within n modell drawne by Sir Xtopher Wren, the cloyster should reach unto Mr. East window, but not upon any pa window, and that noe tymber shoulc into the walls of the church or into th Petitt's buildings for supporting the . . . to be supported on substantial fo of Brick soe that the Cloyster shall n or endanger the Church or Petitt's b The Church porch had for many yea in this century been cluttered up wit and chambers.

No drawing exists giving the appe the Old Gate House, taken down and by the existing building by Sir Christop It seems to have been a large edifice on tion of stone and built of brick. The i across the facade by Wren records th its erection, "Surrexit impens Soc. M MDCLXXXIV," and above the entr the Holy Lamb and flag (incorrectly as the nimbus is wanting), with the fig "It is doubtful whether this gatehou regarded as adding to the reputatio great architect."

Temple Church (1800), showing Cloisters designed by Wren.

OOK REVIEWS

stic Architecture of Holland. Edited by . YERBURY. (London: 27-29, Tothill-t, Westminster.) Price 25s.

the constant flow of books on historical ure, most of which are concerned ith churches and religious establish- is refreshing to notice a work such voted exclusively to the architecture me. The book consists of seventy- es of photographs of buildings selected ous Dutch towns, followed by twenty- s of measured drawings; and there and instructive introduction by Dr. Slothouwer. A reproduction in colour, inting by P. De Hoogh, of the interior h house forms the frontispiece to the The photographic plates are clear, hosen in respect to their subjects, and a great variety of phases of Dutch architecture of the seventeenth and centuries. They illustrate dwelling- public buildings and warehouses; devoted to fine examples of doorways, gateways, and pumps, while others teriors and internal fittings. These nnot convey an idea of the colour hich plays so important a rôle in omestic architecture, but they do he general grouping of wall spaces and and the reserve and charm of the How great is the value of large wall an architectural composition is well such examples as that reproduced in from Staphorst; and of fine brick- the example from Amsterdam, on while the fine effect possible with f the materials at the disposal of the well exemplified on plate 47, from

to be regretted that no space has d for a plan of any of the buildings l, or, indeed, of any other building. raph or measured drawing of a façade eful as a study of composition, but it far more intelligible and instructive ompanied by the plans from which eloped; its genesis is then clear, and of the whole infinitely greater

tch houses were generally built side eside a street or canal, on which they a narrow frontage, which, even in the ns, was not more than 15 ft. wide. w side of the house being thus against , it naturally formed the gable end. unts for the rows of tall and narrow ich form so familiar a feature in old wns, each façade being finished with aried according to the taste or means ner, or according to the date at which ilt. Stone is not found in Holland, of this material as is used, either alone njunction with brick, was imported. deficiency is amply compensated for ck clays which are found in abundance e boundaries of the country itself and oduce bricks of a considerable variety , though they are generally of a bright wards the end of the seventeenth he bricks were treated with oil or tar t their absorption of moisture, a pre- endered necessary owing to the very nosphere of the Low Countries, and, in time, these toned to a dark brown. ow bars and frames were painted white the doors and ironwork dark green; ses where the gables were embellished e decorations, these decorations were ed, usually in cream. In addition to window panes of the seventeenth and centuries, on account of the use of e containing silver in the process of nufacture, attained in time a violet ich, though not discernible from within, ly seen from the outside. The whole herefore, presents a chromatic scheme, st be understood in relation to the nd grouping of parts, and is a very t factor in the general effect produced. ental emphasis of important features by shadows obtained by the slight setting back of the window frames from the wall face and the projection of the coping beyond it—introduced for practical reasons—also enhances this effect.

There is much to learn from a careful study of the domestic architecture of Holland. Having for centuries employed bricks as the principal building material, the Dutch have acquired a power and freedom in their use of brickwork which is characterised by refinement and skill, indeed, often with daring. Of late years, owing to its use as a covering for the actual structural members, this freedom in the employment of brickwork has, in many cases, developed into a certain abandon which can scarcely command unqualified approval, but the work produced during the seventeenth and eighteenth centuries and illustrated in this volume will well repay a careful examination. The plates of measured drawings, which are of façades and of doorways, gateways, internal fittings and other details, are well and carefully drawn. Many of the subjects are also illustrated among the photographs and have cross references to the photographic plates. These drawings form a most valuable adjunct to what is a useful work.

L'Arte di distinguere gli Stili. By ALFREDO MELANI. 2nd edition. (Milan: Ulrico Hoepli. L.26.)

In his preface to the second edition of this, the first volume of his trilogy on the art of distinguishing styles, Prof. Melani states that three years' serious private study is worth ten at an art school or university. A lengthy experience has taught him that artists generally lack the historical knowledge necessary for the full appreciation of a work, which they judge solely by æsthetic standards. Certainly the Professor, by means of his Hoepli manuals and other books, has done much to provide the Italian student with suitable material for self-culture.

The present volume treats of architecture, sculpture and, in a lesser degree, decorative art. The space allotted to the so-called "minor arts" (a term which arouses the author's indignation) has been increased in this new edition, and the outstanding features of each style as applied to wood and metal work, ceramics, &c., are indicated, typical examples being given. The lists of these have in every case been carefully compiled. Where possible, the architectural, sculptural, and other works mentioned are Italian, and care has been taken to include examples from all over the country, so as to enable the student to see specimens near his own home. Not that the work of other nations has been overlooked when it "inspires, disciplines or governs"—as in the case of Gothic where, after describing the features and work of the various architectural schools in Italy, Prof. Melani gives a list of representative examples—entirely French.

Of special interest are the 262 illustrations, mostly from sketches by the author drawn at the time he was writing the book. They complete and illuminate the text in a way that photographs could not do, and permit of the inclusion of a number of details from lesser known works.

In a stimulating introductory chapter on "Style and Styles," the folly of seeking to establish a hierarchy in works of art is emphasised, since their æsthetic value lies in the artist, not in the material used. As water finds its own level, so does the true artist find his material and subject, by instinct not by selection.

EXHIBITION NOTES

THE R.B.A.

The R.B.A. is a very good exhibition, and probably, on the whole, one of the most vitally interesting we have had for some time, for it contains so much that is sincere and unobtrusive, and in keeping with the best tradition of our art. There is an unusually large proportion of architectural or building subjects, from the powerful drawing of Sir Richard Whittington's house (225), by G. A. Cox, and his Isaak Walton's house (221), to the fine impression of Truro Cathedral (140), by Barry Pittar. An excellent small drawing is that of the Bank of England Court Room (179), by J. F. Wilson; and a clever drawing of melancholy suggestion is the "Passing of Regent-street" (221), by W. E. Willats. Nos. 80, 202 and 206 are amongst the more interesting studies of building. The sparkle and interest of river scenery with its shipping are very effectively shown in "Alongside the Pool" (321), by W. Edward Riley. We cannot do justice in brief notes to the many excellent landscapes, which mean so much of the value of the exhibition, such as the brilliant sunlit meadow against purple hills and grey sky, by Leonard Richmond (85), the charming winter scene, "Melting Snow" (147), by J. Paul Brinson, the dark towered landscape (168), by Thurston Laidlaw Shoosmith, the same artist's "In Wensleydale" (174), and the able drawings by Hesketh Hubbard (633, 26, and 387).

R.I.B.A.

A small but interesting exhibition is now being held at the R.I.B.A. Galleries of water-colours by the late Sir Ernest George, R.A., and Y. E. Collcutt. There is a thoroughness and sincerity in the works which are well worthy of study by our young men. If they are devoid of the "slickness," thought so much of to-day, they are truthful and pleasing in colour, and the possession of one would at all times give pleasure. Sir Ernest's drawings show some charming examples of Dieppe, Naples, and Rome, excellent in their simplicity and technique; and Collcutt's, if not quite so delicately handled, are capital drawings, notably Bosham and Dunwich, typical English scenes. A good drawing of Ronda Cathedral is also well worthy of notice. The exhibition is open until November 15.

MODERN TOWN GROWTH

MR. WILLIAM HAYWOOD, in his fourth lecture at Birmingham University on town planning, said during the nineteenth century commercial and industrial towns in England lost that clear definition of form which was so apparent in ancient cities. The absence of need for military defence, and a rapid increase of industrialism, led to an irregular growth of towns often far beyond the Parliamentary boundaries.

Thus modern maps which represented cities as administrative areas only were apt to create a wrong impression of town-planning problems, which should be independent of such arbitrary definition because intimately connected with adjoining and even distant areas.

Modern town growth in England was best seen in the latest density maps of the Royal Geographical Society's Atlas, where a great part of Lancashire appeared as practically one great town, of which Oldham, Wigan, Bolton, &c., were the producing centres, Manchester the market, and Liverpool the seaport. Glasgow was joining up with the Clyde ports and even reaching out towards Edinburgh. The Midlands, South Wales, South-West Yorkshire, and East Durham, all tended to merge their towns into town belts, which, it should be observed, were situated more or less upon the coal measures to which they owed their position and development.

The housing evils of the nineteenth century were due to the ungoverned growth of towns, and were first checked by the powers which the Public Health Act of 1875 conferred on local authorities. Under recent town-planning legislation the future extension of great cities would avoid the evils of the past.

The doctrine of Mr. Ebenezer Howard and others that great towns were necessarily evil and so should be artificially limited in extent, had led to the building of self-contained garden cities of from 30,000 to 50,000 inhabitants, governed by a new policy of control; and as a variation of this idea, it was proposed to absorb the excess population of great cities by means of satellite towns, separated from the parent city by park belts, yet effectively associated with it by rapid transport services.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

****** We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Decoration of Walls.

SIR,—I should be very grateful if any of your readers could help me with the following :—

It is desired to re-decorate the walls of a room about 25 ft. by 25 ft. by 12 ft. high, and used for small public meetings.

The walls at present are "fair faced" and distempered, and we now wish to either plaster the walls or render in cement, to bring to a smooth surface, and then distemper and paint.

If one good coat of Portland cement is applied, followed by one coat of Keen's cement, will the painted dado, and the distemper above lose its colour or flake off ?

Could you tell me what the approximate cost will be ?

It is desired to decorate the walls straight away, and not wait a period of some months for the work to dry out.

"STUDENT."

Floor Coverings.

[REPLY TO "FLOORING," OCTOBER 31.]

SIR,—It is probable that what "Flooring" describes as "sweating" of the concrete floors which have been laid some time is really due to the concrete being insufficiently dense and allowing the moisture to come through from below. This is the more probable as the trouble is only experienced, apparently, on the ground floor.

The only remedy, I fear, would be to strip off the rubber covering, thoroughly clean the concrete and apply three coats of a 4 : 1 : solution of silicate of soda, allowing each coat to dry before the next is put on. The solution should be applied with a soft brush or mop.

T. J. CLARK.

SIR,—I wonder whether "Flooring" has met the same trouble of which I heard recently. This was an instance of a rubber floor that was given to rising long after all moisture should have been given off from the concrete. The trouble was laid at the door of the too zealous cleaners, who were instructed to be very sparing in the application of water thereon, and I believe it is a fact that there were no more complaints after these instructions had been followed. Cement concrete should not give off moisture after it has once finally set, or it points to improper materials. The use of sea-sand might cause it, and this is a very serious fault. If there is anything of the kind in the case in point, I should advise the coating of the surface of an experimental section with good waterproofed cement, and then trying the ordinary adhesive solution. First, however, have a talk to the cleaners and be sure that this is not the simple cause. Rubber flooring is such an ideal floor covering that it is worth exploring all roads before abandoning the use thereof.

"SOFTLY."

SIR,—It will be useless to attempt fixing the rubber flooring until the concrete becomes thoroughly dry.

The present rubber should be taken up and, if possible, the concrete left uncovered. The period may vary from a few days to perhaps a month.

When the sub-floor is really dry the rubber should be fixed with rubber solution such as used by the manufacturers of rubber flooring. Cold water glue is not a satisfactory medium for sticking rubber.

Probably it will be found that the rubber has stretched, and it should therefore be cut to correct size before being relaid.

Cement waterproofing brushed on the concrete is useless, as this will not adhere properly to the concrete, but only forms a skin which will break away.

"RUBBER FLOORING."

Concrete Garage.

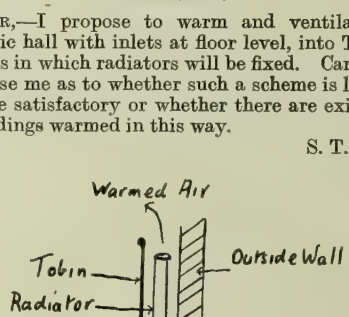
SIR,—I have had a garage, 14 by 8, built in concrete, into the foot of a steep chalk hill. It is built right into the chalk (with about 18 in. of top soil) on its three sides, up to about 7 ft., the remaining foot being above and clear of the soil. My builder now informs me it never will be dry and fit to keep a car in, as, the chalk being porous, and the hill sloping down to the garage wall, all rain will drain down to it. Can you suggest an inexpensive remedy, please ? I have thought of cutting out all round one side and back, about a foot or so, as an air space, but I cannot do this on the third side as it is built on the dividing line of my neighbour's land, and I am not even sure if it would stand and be safe if left on its own. The roof is reinforced.

W. STEVENSON.

Filter Beds.

[REPLY TO SANITAS, OCTOBER 31.]

SIR,—With reference to the query of "Sanitas" in last week's *Builder*, my experience is that the best filtering medium for a small domestic septic tank is clean, hard, furnace clinker, that will not disintegrate, and which provides the necessary interstices. This medium should be graded and laid in the bed in three equal layers—2½ in. at bottom, 1½ in. to 1 in in the middle, and ¾ in. to ½ in. top layer. I have put down numbers of beds thus with excellent results.



There are, however, many other requirements necessary to get good results : correct computation for the size of the bed, aeration, distribution, &c. ; but providing "Sanitas" is acquainted with these details, and will construct the bed as above I think he will get complete satisfaction.

W. B. SEWARD, M.R.S.I.

Ventilation.

SIR,—I propose to warm and ventilate a public hall with inlets at floor level, into Tobin tubes in which radiators will be fixed. Can you advise me as to whether such a scheme is likely to be satisfactory or whether there are existing buildings warmed in this way.

S. T. C.

Contaminated Water.

[REPLY TO "YOUNG BUILDER," OCTOBER 31.]

SIR,—Every owner of land is entitled to sink a well on his own premises and so obtain a supply of water, even if in so doing he drains off the water from his neighbour's well. But when a well is polluted (*i.e.*, something is added which changes the qualities of the natural water), the rule of law is "that you must not injure the property of your neighbour, and that, consequently, if filth is created on any man's then, in the quaint language of the *Rep Salk* (361), 'he whose dirt it is, must k that it may not trespass.'" See Hodgkin Ennor (1863), 4 B. & S., 229.

Again, in Ballard *v.* Tomlinson (1885), D. 115, Lindley, L. J., said, "No man right to use his own land in such a way a a nuisance to his neighbour, and wheth nuisance effected by sending filth on his bour's land, or by putting poisonous mat his own land and allowing it to escape neighbour's land, or whether the nuisa effected by poisoning the air which his neig breathes, or the water which he drinks, a to me immaterial. If a man chooses to pu on his own land, he must take care not it escape on to his neighbour's land."

It does not matter whether the polluted flows in a known or unknown chann trickles over the surface of the land or lates through the soil, or flows through a ficial channel of a permanent character. Fu where water flows in an unknown chan percolates through the ground, no rig pollute it can be acquired by prescriptio

The first point to be determined, by examination, is who it is has infringe enquirer's right. Is the source of the pol from an adjoining neighbour's land, o caused as the enquirer states in his que If it is a private owner, then his remedy seek an injunction and damages. It necessary to prove actual damage—mere of duty gives a good cause of action t person injured. If the source of the pollu from the main sewer, then, since the authority has obtained limited owners the sewer (under, *e.g.*, the Public Healt 1875), the enquirer has no other remedy to claim a mandamus to command the dants to discontinue the nuisance—fo local authority is not liable for "non-feas *i.e.*, the failure or omission to perform se which there is an obligation to perform—t it is liable for "mis-feasance," *i.e.*, th proper performance of some lawful act an action for injunction and damages lie. In Jone *v.* Llanrwst Urban C however, Parker, J., granted an inju against the local authority for neglecti prevent sewage escaping from their sewe

"DUR

Keene's Cement.

SIR,—I know of one or two architect make it a practice to specify all Keene's c work to be on a backing of the same ma instead of the usual Portland cement ba Are there any of your correspondents wh explain the reason for this practice, an advantages, if any, that follow ?

"QUER

MINGLING OF EASTE AND WESTERN ART

SIR BANISTER FLETCHER, F.R.I.B.A., le recently at the Central School of Arts and on the Romanesque buildings of Norther Central Italy, which, he said, presented contrasts. In the case of Southern including Sicily, architecture and history closely interwoven, and very varied pha artistic design—Byzantine, Norman, Sarac illustrated the successive religions and ci tions of its occupants. A solidity of str indicating European tradition was con with a blaze of colour of Mohammedan Sir Banister gave interesting views of Pa with that fine building the Martorani Monreale Cathedral, which combined a B basilican plan with Byzantine wall mosaic a roof of Saracenic character, the cloisters c adding the characteristic Romanesque The architecture of Sicily was thus carr unceasingly by mason and carpenter, decorations by the worker in metal and n leaving the unmistakable impress of each

The next lecture will deal with the archit of the succeeding (Gothic) period in No Italy.

THE BUILDING TRADE

HE FUTURE OF HOUSING SCHEMES

FROM A CORRESPONDENT.

change of Government will no doubt he future of many projected housing in various parts of the country. The should not be a political shuttlecock. chitects and builders in many districts he present time negotiating with local ies plans and tenders for housing . In some cases the housing com- have held their hands, because they ot decide whether they preferred to e increased subsidy offered by Mr. y rather than the smaller Chamberlain In other cases, as in South Essex, have, we believe, postponed making ision for another three months. There r instances, notably in colliery districts, ompanies after balancing the merits of schemes have decided to adopt the rlain subsidy.

pecial conditions imposed under the y scheme are likely to lead to con- e trouble and expense. There is first ssity that all the houses should be let han that they should be sold. Some treasurers, who have studied the com- ive regulations setting forth the rules to owed in determining the appropriate rent, confess that they are somewhat Particulars of the current rents of -class houses of all types erected in a before the war have to be obtained. articulars have to be divided, as they two main classes of houses, parlour and lour. Then, if there is a marked ce in the levels of rent in different parts area, a further sub-division has to be After all these statistics are arrived at, lved calculation has to be made in order the "final" rent. But this so-called rent may again be altered if any l change takes place in the level of the district, and also if costs have p, and the estimated annual loss of se exceeds the equivalent of £4 10s. or forty years.

ipal officials are not likely to embark some hesitation on a housing pro- surrounded by so many difficulties, majority of local authorities have so ed very warily before taking any action under the Wheatley Act. The therefore, before the new Minister of whoever he may be, will be to meet any delay the demand of the repre- s of local government in this country efinite lead on this question. It is l that Mr. Neville Chamberlain will o the Ministry of Health, and those s and builders who have come in contact will agree that he, at any rate, is a has first-hand and practical knowledge ubject.

s incline to the view that it is quite ry to repeal this Act. In any case plenty of loopholes for escape provided ct itself, by which any Minister of ay "reverse engines" without going ment for permission to cancel recently gislation. There is, for example, pro- de in the Act that when two years sed, i.e., after October 1st, 1926, the s to be reviewed in consultation with tives of local authorities and, if the uilding and other conditions warrant on, the contribution will be reduced. more important as a way of escape Wheatley commitments, the next f Health may seize on the provision ar's Housing Act by which, "in the he cost of houses being found, after ry, at any time to be unreasonable, er and the Scottish Board of Health an Order to be submitted to Parlia- ment terminating the Exchequer liability to make contributions except in so far as houses have already been completed." Under this provision the next Government can find a very simple way out.

But in the interests of housing it is essential that there should be no undue delay in coming to a decision. It should be a comparatively simple matter for the future Minister of Health to state quite clearly whether he intends to encourage housing under the scheme of Mr. Chamberlain's Act of last year, which has already resulted in over 164,000 houses being authorised.

Much more, too, can be done to assist private enterprise without any further legislation being necessary. More attention should be given to the powers granted under the Acts of 1923 and 1924 to advance loans to builders and others for the construction of houses of which the estimated value does not exceed £15,000. Both local authorities and county councils now possess the power to lend money to builders, to private persons who are desiring to build for their own occupation, and also to public utility societies and building societies. As very little publicity has been given to this matter, comparatively little advantage has been taken of these powers. Builders looking for capital will note they may obtain assistance in this manner. The loans will be secured by mortgage, and builders will not be able to obtain more than 90 per cent. of the value of the interest of the mortgagor in the property. A local authority now has power to make advances up to 50 per cent. of the value of the work done. This includes the value of the builders' interest in the site.

This is only one aspect of existing housing legislation that may be of practical importance to the building industry. The first necessity, however, is that a clear statement should be issued by the new Minister of Health as soon as he is in the saddle so as to blow away all the suspicions that have been aroused during the recent political struggle, and make clear to the country what line future housing policy is to follow.

NEW METHOD OF COTTAGE BUILDING

NINE local authorities have, we are informed, definitely adopted the system of house construction invented by a Blackpool architect, Mr. Edgar D. Dennis. Already a number of houses on this system have been erected at Blackpool, and a further scheme is under consideration. The York City Council has adopted a scheme for three hundred houses that has just been sanctioned by the Ministry of Health. In addition, St. Helens has adopted a scheme for 60 houses; Dudley, for 24 houses; and Preston, Walsall, Horwich, Ashton-under-Lyne and Bristol have agreed to build on this system, but the exact number is not yet settled. Several public utility societies have also projects under consideration.

The system, in the main, relies on a steel frame, which carries the entire superimposed loads direct to the foundations, and in turn supports patent roof trusses. The stanchions which carry the steel horizontal members are built on concrete padstones which are formed on a reinforced concrete raft or fender. This, in turn, acts as a foundation for the ground floor walls. The first floor and superstructure are carried by this steel frame, and it is claimed that, as the upper story can be completed first, this enables all trades to work together immediately under cover.

The ground floor walls have an outer shell and an inner shell with a wide cavity between to prevent the passage of moisture to the interior of the houses. The outer shell is of brick, while the inner is of thick breeze. The chimney stacks are carried up in brick in the usual manner. The first floor exterior walls are timber framed. It is claimed that all the timbers are perfectly ventilated, thus preventing both dry and wet rot. The ceilings are lined with an approved fibrous asbestos sheet.

The inventor states that the number of bricks required per house is only one quarter of that required for an all-brick house of equal dimensions, and that the steel frame for a block of four houses can be erected by three ordinary labourers in seven hours. After this, it is said that the first floor walls and the roof can be proceeded with immediately, and can be completely covered in by the end of the fourth day. A block of four houses could be ready for occupation in twelve days. At Blackpool, a staff which at no time exceeded 45 men are stated to have erected 80 houses within a period of little over four months.

At York the scheme is to be carried out by Messrs. H. Shepherd & Son, of York. Before the York Corporation passed the scheme, the system was investigated by the Housing Committee and by Mr. F. W. Spurr (the City Surveyor and Engineer).

LAND FOR CROYDON WIDENING

SIR ANKER SIMMONS, K.B.E., Official Arbitrator under the Acquisition of Land (Assessment of Compensation) Act, 1919, has issued his awards in three claims against the Mayor, Aldermen and Burgesses of the County Borough of Croydon by owners of property which has been acquired by the Council for the purpose of widening Brighton-road, Croydon.

The Governors of the Whitgift Foundation in Croydon claimed in respect of part of Hayling Park, part of Hayling Park Cottage, and part of Hayling Cottage, all situated in Brighton-road. The award is as follows:—(1) The Acquiring Authority to pay the claimants as compensation the sum of £1,516. (2) The Acquiring Authority to pay the fees on this award. (3) Each party to pay its own costs.

Mr. Albert John Schaefer claimed in regard to part of No. 2, Brighton-road, comprising an agreed area of approximately 837 square feet. The award is as follows:—(1) The Acquiring Authority to pay the owner-occupier in respect of the above land the sum of £56 10s. (2) The Acquiring Authority to pay the owner-occupier in respect of injurious affection or consequential damage the agreed sum of £50. (3) The Acquiring Authority to pay the fees on this award. (4) The Acquiring Authority to pay all other reasonable costs.

Mrs. Emma Maria Stiby claimed in respect of part of No. 4, Brighton-road, comprising an agreed area of approximately 796½ square feet. The award is as follows:—The Acquiring Authority to pay the owner-occupier in respect of the above land the sum of £53. (2) The Acquiring Authority to pay the owner-occupier in respect of injurious affection or consequential damage the agreed sum of £40. (3) The Acquiring Authority to pay the fees on this award. (4) The Acquiring Authority to pay all other reasonable costs.

Steel Frame Concrete Houses.

The York City Council has agreed to a contract for 300 houses of steel frame concrete to be erected within a period of 18 months at a cost of £175,000.

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., Assoc. Surveyors' Institution, F.R.San.Inst. (Barrister-at-Law).

XVII.—NEGLIGENCE, NUISANCE, INSURANCE.

"NEGLIGENCE" and "nuisance" are wrongs to persons and property in general.

Certain acts are, however, authorised by Statute to be done in certain cases, where, though they may be a nuisance to a minority of those concerned, are a benefit to the majority; and authority is given conditionally on such acts not being made a public nuisance, *e.g.*, running a railway by the side of a road, or running a traction engine along the highway.

In order to succeed in an action for negligence or nuisance, "special damage" must be shown, *i.e.*, actual loss suffered in addition to the wrong for which general damages are awarded to the injured party.

Negligence.

"Negligence" has been defined as the wrong done by a person, "being under a duty to use care, and not doing what a prudent man would do, or doing that which a prudent man would not do, and thus causing damage." The burden of disproving negligence, where a contract exists between the parties, lies on the defendant; and, where no contract exists, the burden of proof is on the plaintiff; it must, further, in the latter case, be shown that there was a duty cast on the defendant to use care.

In certain cases, persons are bound to use *extreme* care. In Fletcher *v.* Rylands (1866, L.R. 1 Exch. 265), the rule was laid down that a man bringing dangerous property on to his land is bound to keep it confined within his own premises, at his peril; for example, where a reservoir is constructed on land, and it overflows and causes damage to adjoining property, the owner of the reservoir is liable; as he is also if a fire is lighted on his premises and spreads, causing damage to neighbouring property. However, when the damage is the result of an "act of God," as in the case of a great storm causing the reservoir to overflow, or where, as in the second case, a third party lit the fire, then the owner of the source of damage would be exonerated from blame.

Owners of property must make reasonable provisions for the safety of passers-by and others, though that duty has its limits—see Walker *v.* Midland Railway (1886, 2 T.L.R., 450), and Thatcher *v.* Great Western Railway (1893, 10 T.L.R., 13).

There appears to be a wider duty towards children than towards adults. A child climbed a fence near the highway, the fence gave way and the child was thereby injured. It was proved that the fence was defective, and the owner was held liable for the injury to the child.

If a person enters on premises, on business and by invitation, and he sustains injuries from an accident due to any part of the premises being unsafe, the owner of the premises is liable (see Heaven *v.* Pender—1883, 2 Q.B.D., 503).

Contributory negligence on the part of the plaintiff may be pleaded, if it can be shown that such was the proximate or decisive cause of the injury received.

If the accident has resulted also in damage to the property, where both parties are equally at fault, neither can claim damages.

Nuisance.

A nuisance may be a public nuisance, as when a person blocks up a public highway; or a private nuisance, as when an offensive trade is carried on.

No person can recover damages for a public nuisance, unless he can show that it has resulted in inflicting some peculiar damage on himself, as, for instance, if he has the misfortune to fall into a trench made in the public highway, and into which any other wayfarer might have fallen; this is the case, equally, whether the trench is made by the local authority or by any other (say, gas, water or electric light company) having statutory right to open up the road. He must have suffered some substantial damage over and above that sustained by the public at large.

A person cannot sue a local or public authority for an offence of omission ("non-feasance"), but only for improper performance of some lawful act ("mis-feasance"). So if a local authority fails to keep a road in repair, and a person sustains injury as a result, the latter cannot sue the local authority for damages.

It is no defence for a nuisance, to plead that it has existed for a period of time, and that the plaintiff came voluntarily to the affected area knowing of the existence of the said nuisance—for instance, a soap works—and that he could have stopped away if he objected to it.

However, there is recognised a different standard of comfort for different localities; and such standards are essential factors in determining if the cause of complaint constitutes a nuisance.

For instance, it would be no use for a man to go and live by a docks, and then try to bring an action to stop the noise of ship-building and other customary business.

Building Operations.

Building operations may be commenced at 6.30 a.m. if annoyance is not caused wantonly to adjoining owners, even though loss may accrue thereby to those owners. (See Clark *v.* Lloyds Bank (1910) 79 L.J., Ch. 645.)

A contractor must not occasion inconvenience to adjoining owners by taking advantage of certain streets or passages where others are available for his use, though less convenient to himself. (See Fritz *v.* Hobson (1880), 14 Ch.D., 542.)

A person who, although within the due exercise of his rights, interferes with or obstructs a highway, rendering it less safe for the public use; or who, in exercising his rights of access to his premises, either by means of the highway or a public navigable river, without having any regard to the right of his neighbour's rights thereon, creates a nuisance, and is liable for negligence.

Also, if operations are carried on at unusual hours of the night, when there is no express necessity, or the road is injured by running unusually heavy traffic thereon, or such noise or vibration is caused as materially interferes with the comfort of neighbours, when the locality is not one where such noises are usual or to be expected—in all these cases the aggressor is liable to the sufferer.

In general the employer, or owner, is liable. The contractor, however, accepts liability by signing a contract to do so (under which contract the building, during execution and until handed over, becomes vested in him). The architect, being an agent, would only be liable where the trouble was the result of his having misled the employer, and having instructed the contractor to perform such works as his due care and skill should have convinced him were unlawful or dangerous. If the enterprise itself is unlawful, the employer cannot claim indemnity from the contractor.

Insurance.

Under an "entire" contract, if a new building is at any time, before being handed over, destroyed or damaged by fire, the contractor is liable to the building owner for loss. But in cases of repairs and alterations, the owner bears the loss; but only for such materials as are fixed, and work already done to the property. Materials stored on the site are the property of the contractor. It is therefore prudent, on the part of the contractor, to insure against fire; since, in general, he has an insurable interest, which interest must, however, exist at the time of the loss. Building contracts usually contain a clause that the contractor must insure. When a proposal for fire insurance has been accepted, there is a binding contract in force. The policy need not b executed, if a fire occurs, to make it l

Reinstatement.

Insurers usually reserve the right of re as an alternative to payment of the money, where buildings are damaged And an average clause in a fire polic provides that the insured shall not greater proportion of his loss than the bears to the total value of the propert

Section 83 of the Fires Prevention (M Act, 1774 (an Act which applies to England and Wales) enacts that an company may exercise the option to In some cases persons interested may that the company shall reinstate. Se *v.* Royal Insurance Co. (1859, 1 E. & A contractor may reserve the right, as himself and the employer, to make goo caused by fire himself as an altern payment.

Anyone who once elects to carry out accepts all liability for defects in the w done, and for risk from any subsequen by fire during progress. Also, the w be done in such a way as to restore the to its former state, as far as is possi insuree is entitled to peruse the specifi works for the reinstating; and, in an avoids disputes if this is submitted to

The insurer or the contractor, which who reinstates, is entitled to all salvage, re-use such material as is not unfitted fo though it would appear that the emplo architect may question the condition o material which is being again brough work.

Colliery Housing Scheme.

A contract has recently been settled houses, to be built for the Bestwood Iron Co., in the Midlands. In this Chamberlain Act of last year that was by the late Government, to be in operat 1939, is to be utilised, and a subsidy house will be applied for. The Hous poration of Great Britain is responsibl arrangements for their erection. The a are Major Douglas Wood, who was Housing Commissioner for the Midland Dr. Addison, and Mr. Lloyd Thomas, Housing Commissioner for South Wal houses are to be built of bricks, but it stood that in some cases they may structed of concrete.

London Town-Planning Schem

At a recent meeting of the L.C.C stated that the necessary steps had be to advertise the Council's decision of that a town-planning scheme be prepa reference to an area situated within th politan boroughs of Woolwich, Green Lewisham. This area includes Charlto which was completed by Inigo Jones It has been stated that this house acquired for use as a town hall in Gree

The Council further state they have with the district surveyors that perso ing to proceed with building proposal informed of the necessity of obtai Council's consent to interim developm article 3 of the Town-Planning (Gener Development) Order, 1922. They h sented under this Order to the er Messrs. Eaglen Bros. of six houses Ash-hill, Lee, in accordance with the plan. The London Society has offere the Council the user zoning maps metropolitan boroughs north of the as and when they are compiled. Th has accepted the offer and have agreed to lend the Society the maps of t politan boroughs of Lambeth and S which have been prepared under their The Council have also continued the gations into the conditions and circu legal and otherwise, affecting the squares in London (not included in th to the London Squares and Enclos servation) Act, 1906), and the possibl the judgment in the Edwardes-squar

NEW CINEMAS

A. Hill, the Scala Theatre, Ryde, Isle of t, is contemplating the erection of a new a in Mill-street, Newport. Plans are in ands of Mr. F. W. Groundsell, Wellington e, 77, George-street, Ryde, but no contracts e placed for a few months.

ew cinema and dance hall is to be erected ndon-road, Norbury, S.W. 16, for which have been prepared by Mr. Frank Jennings, . James's-street, S.W.1, and the cinema is ccommodate about 1,000 persons and ance hall about 300. Contracts are to be l very shortly.

ns have been prepared by Mr. James R. orth, 14, Edgar-street, Accrington, shire, for structural alterations to the a in Peel-street, Accrington, for Palace es, Ltd. We also understand that a e has been promoted by the Reading Theatre of Varieties for the rebuilding theatre in Cheapside, Reading. Plans the hands of Messrs. Sprague & Barton, ment's-inn, W.C. 2, and the structure is ed to accommodate about 1,000 persons. scheme, we understand, is in its early , and no contracts will be made for some

s stated that Mr. R. Graham-Yooll, pro- of the Marine Gardens, Seafield-road, ello, has under consideration the erection new picture theatre at Abbeyhill, Edin- The scheme is in its early stages and no ct has yet been appointed. The building accommodate about 2,500 persons.

gress is being made with the erection new picture house at the corner egent-street and Jermyn-street, W.1, uilt for the Regent Jermyn Theatre Co., of Austin Friars, E.C. 2—a £250,000 n. The general contractors are Messrs. Vigor, Ltd., of Knightsbridge, S.W. 1, sub-contracts placed are for steelwork Messrs. Moreland, Hayne & Co., Ltd., of swell-road, London, E.C.1, and Messrs. , Austen & Young, 12, Buckingham- Strand, W.C. 2. site of Nos. 62–65, Haymarket, S.W., is being excavated, and existing foundations removed, in order to make way for the new "Carlton" Theatre. The building will be built on a steel framework, with cantilever balconies and an exterior facade of Portland stone. The total number of seats to be provided will be 1,200; whilst considerable space will be devoted to lounges, refreshment rooms, &c. The total cost of the building is estimated at £160,000. The site has an area of 12,170 ft., with a rear frontage to St. Alban's-place. The architect is Mr. Frank T. Verity, F.R.I.B.A., 7, Sackville-street, W.1, acting on the instructions of the Carlton Theatre Co., Ltd., of Austin Friars, E.C.2.

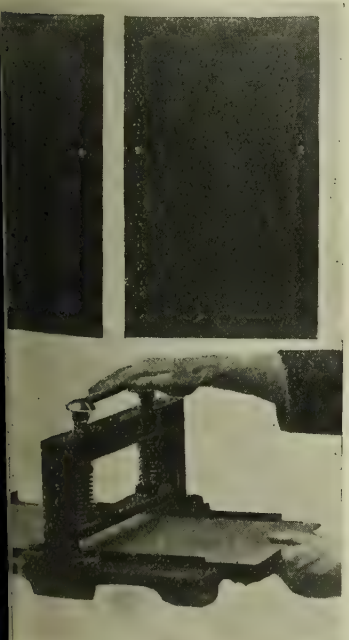
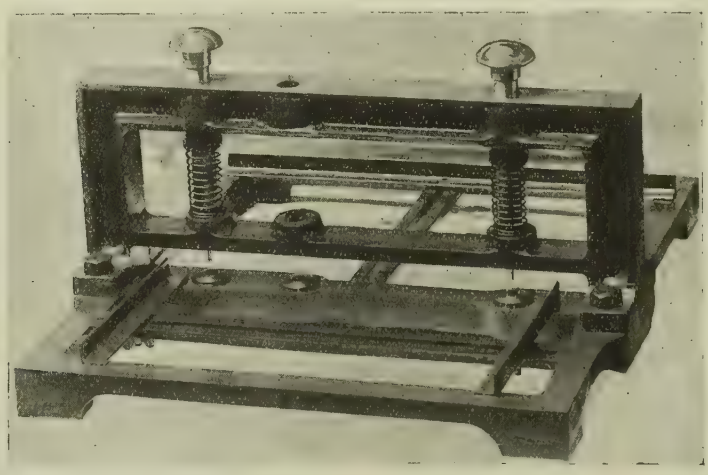
The Leeds Corporation propose to build a large concert hall, with cinema equipment, capable of seating 5,000 persons, at a cost of £70,000.



NEW INVENTION



Slate-Punching Machine.

A simple and effective machine, designed for the purpose of preventing wastage of slates by breakage when punching holes in them, has been put on the market by Messrs. "Lion" (Patent) Machine Co., of St. Margaret's-road, Whitchurch, Cardiff, and is illustrated on this page.

This strongly built machine expeditiously punches the two holes necessary in any size slates for securing them firmly to the battens, without moving the slate when once set in the machine, and countersinks the holes in one operation in such a manner that the minimum amount of counter-sinking is effected, and thereby the top of the nail heads will fit level only with the surface of the slates; thus the maximum thickness of slate will then be available to receive the body of the nail, which is a tight fit, and, in consequence, the strength of the slate is in no way impaired by the operation. The punching of such holes is effected by the difference in the size of the die, the end of the punch, and the small flat bearing surface on top of the die on which the slate rests, and which gives the support necessary to avoid breaking any slates or impairing the thickness during the punching operation.

The following are the claims made on behalf of the machine by the makers: (1) Perfect countersunk holes; (2) body of nail a tight fit in hole; (3) head of nail a perfect fit in countersink flush with surface of slate; (4) machine is designed to punch all sizes of slates; (5) there are no breakages; (6) 700 slates can be punched per hour; (7) special care has been taken both in design and material used to make a most durable machine, there being nothing to break or wear out; (8) the price of the machine will be easily saved on a single house by the entire absence of broken slates and the difference in labour costs.

Slate-Punching Machine.

RENTS IN AMERICA

The Index recently issued by the New York Trust Company states rents in the United States in June, 1924, were higher than at any time since 1914. The average increase in rents for low and moderate-price accommodations between July, 1914, and June, 1924, was 85 per cent. This increase in rents is considerably greater than the increase in the cost of any other major item in the family budget. In the seven months previous to June, 1924, the increase in rents was 3 per cent., and from March, 1923, to June, 1924, the increase was 9 per cent. In the last ten years the proportion of rent in family expenditures reached a low point of 12.8 per cent. in 1918, while in March, 1924, the latest figure given by the National Industrial Conference Board, this percentage was 20. No changes in rents from November, 1923, to March, 1924, were reported from 83 cities, while there were increases in 69 cities and decreases in 26 cities. The greatest number of increases in average rents in these four months was reported from the eastern and middle-western sections. In the east rents increased in 31 cities. Six cities reported rises of from 11 to 20 per cent. The 24 other cities showed increases of 10 per cent. or less. The south was the only section for the country where more decreases than increases since November, 1923, were reported.

Delville Wood Memorial.

This memorial, which is being erected on the site of Delville Wood to the South African Brigade, is expected to be completed in the early part of next year. By the end of this year the whole of the masonry work will, it is understood, be completed. The chief features of the scheme, which has been designed by Mr. Herbert Baker, F.R.I.B.A., is a central arch with side pavilions, and in the centre of the foreground will be a memorial cross.

A Commemoration Dinner.

A dinner was recently given by Mr. W. R. Rawlings, of Messrs. Rawlings Bros., Ltd., at the Vanderbilt Hotel, to commemorate the addition to the directorate of Mr. J. Kirkham, who for many years had acted as secretary of the Company. Mr. Kirkham will also act as joint managing director with Mr. W. R. Rawlings, in place of Mr. John Rawlings who, although retiring from the managing directorship, will retain his seat on the board, and will act as technical adviser to the Company.

Demolition of Bradford Slums.

A scheme recently put forward by the Bradford City Council for the demolition of the White Abbey slum area and the erection on the site of new houses has recently been approved by the Ministry of Health. The expenditure involved in demolition and rehousing will, it is stated, be £235,766. The order of the Ministry of Health requires the Council to provide dwellings for 2,312 persons.

NEW BUILDINGS IN LONDON

Hatton Garden.—A new building is being erected in Hatton Garden, E.C.1, to comprise offices on the ground floor, stores and garage. The premises, of seven stories in height, will be supported on a steel frame and the frontage will be of brick with stone dressings. Central heating and electric lighting systems will be installed, together with a passenger lift. The windows will be of the metal casement type. The contractors are Messrs. Kirk & Randall, Ltd., 146, Grosvenor-road, S.W.1. The architect is Mr. S. Gordon Jeeves, of 4, George-street, W.1.

Wembley Park.—A new church is to be built at Wembley Park, Middlesex, from the proceeds of the sale of the site of St. Mary's Church, Vincent-square, S.W.1. The new edifice will be about 190 ft. in length by 100 ft. wide and will consist of nave, side chapels, apse, galleries, sacristy, &c. The first section of the building will include the apse and two bays of the nave. The interior of the church will be plastered and distempered, with Forest of Dean stone dressings. The exterior will be of Luton brown and purple brick and Portland stone dressings. The windows will be of steel and of stained and leaded glass. The builders are Messrs. Holloway Bros. (London), Ltd., Bridge Wharf, Grosvenor-road, S.W.1. The architect is Mr. T. H. Lyon, of the University College of Architecture, Cambridge. The consulting engineer is Mr. F. Broadhurst Craig, 1, Fitzroy-street, W.1. The quantity surveyors are Messrs. Horder & Wells, of 40, Catherine-street, S.W.1.

Green-lanes.—A large building, to be used as a public market, is to be erected in Green-lanes, Finsbury, N.4, on a site with a frontage of about 200 ft. Accommodation will be provided for about 250 stalls, arranged along the walls of the building and in streets down the centre. Steel frame works will be employed to support the building, which will be of brick with a roof of corrugated asbestos cement slates on the lower slopes and glazing, supported by patent bars on the peak. The floors will be of concrete, whilst a considerable amount of glazed tile and brick work will be introduced. Gas, water and electricity services will be laid on for the benefit of tenants, whilst a complete drainage scheme will be constructed. Lavatory accommodation for both sexes will be provided. The architect is Mr. S. Gordon Jeeves, of 4, George-street, W.1.

Golder's Green.—The large residence known as Fernside, in Golder's Green-road, N.W., is to be converted into a social club. Part of the existing building is to be gutted and reinstated, whilst a large dining room, servery and other accommodation will be provided in an additional building. The floor of the principal room will be fitted with a spring dance floor, with a parquet surface. Rooms will be fitted up for billiards, concerts and refreshments, &c., whilst there will also be extensive kitchens, lavatory accommodation, servants' quarters, &c. A similar scheme is now being completed by the same interests at Streatham, the contractors being Messrs. Rice & Son, of 15, Stockwell-road, S.W.9. The architect is Mr. John Hudson, F.R.I.B.A., of 131, Baker-street, W.1.

Woodstock-road.—A new motor garage is to be built on a site in Woodstock-road, Acton, W. The area to be covered has a frontage of about 60 ft. and extends back some 150 ft. A steel-framed building of one story is to be erected, with brick filling. The floor will be of mass concrete, asphalted, whilst the roof will be of asbestos slates. There will be a rest room for drivers, manager's office, &c., whilst the entire building will be extensively lighted by large skylights and casement windows. The architects are Messrs. Hearn & Shuter, of Town Hall Buildings, 12, Heathfield-terrace, W.4.

Fisherton-street.—Two blocks of flats are being erected in Fisherton-street, N.W.8. Each building is arranged to hold 16 flats, consisting of living room, kitchen, scullery, offices, &c., and two or three bedrooms. The work is to be carried out in brick with a few stone dressings on windows and doors. Lighting will be by electricity. The roof will be flat and asphalted. Staircases and landings will be in concrete. The contractors are Messrs. Walter Jones & Sons, Ltd., of 64, Victoria-street, London, S.W.1. The architects are Messrs. Ashby & Newman, of 14, Gray's Inn-square, W.C.1, whilst the quantity surveyors are Messrs. Drower & Brighton, of 28, Victoria-street, S.W.1.

Holborn.—The ground floor of the large new building in High Holborn, W.C., has been acquired by Messrs. F. W. Woolworth & Co., Ltd., of Victory House, Kingsway, W.C. New shop fronts are to be erected and a good deal of shop fitting and mirror building works are involved, the whole of which will be carried out by the company's own construction department, under Mr. W. Priddle, staff architect. The architects to the building are Messrs. Constantine & Vernon, of 82, Mortimer-street, W.1.

Pentonville-road.—The branch shop in Pentonville-road, King's Cross, of Messrs. Freeman, Hardy & Willis, Ltd., boot and shoe manufacturers, of Rutland-street, Leicester, is to be considerably improved, and a new shop front fixed. Work has not yet started, but will be executed by the company's own building staff.

Islington.—A new branch bank is to be opened in High-street, Islington, N., by Messrs. Barclays Bank, Ltd. A two-story building with a frontage in old brick and stone is proposed, with a metal window on the ground floor and wooden casements above. The general contractors are Messrs. Stevens & Sons, of Crouch Hill, N.4. The heating work is being carried out by Messrs. Colley, Meikle & Co., Ltd., 15, Great James-street, S.W.1.

Bishopsgate.—New buildings are being erected on the corner site at Bishopsgate and Leadenhall-street, E.C.3, as an extension of premises for the London & Lancashire Assurance Co., and new offices for the Marine Insurance Co. The new premises will be six stories high with a basement, and will be built on a steel frame with elevations in stone and marble. The floors are of hollow tiles reinforced with steel. A lift is to be installed to serve all floors. The casements for the windows will be of metal, while there will also be ornamental ventilator grilles. The contractors are Messrs. Ashby & Horner, Ltd., of 8, Aldgate, E.1, the excavation and demolition work being carried out by Mr. B. Goodman, of 88, Haggerston-road, E. The architect is Mr. Marcus Evelyn Collins, F.R.I.B.A., of 61, Old Broad-street, London, E.C.2.

Moorgate.—The Ocean Accident & Guarantee Corporation, Ltd., has decided to rebuild its old premises in Moorgate, E.C.2. The new premises will have a street frontage of about 100 ft., and will consist of six floors and a basement. A Portland stone-faced building on a steel frame, with lifts, heating, lighting and ventilating equipment is intended. The floors will be of fireproof materials, reinforced with steel, whilst all the window casements will be of metal; those on the ground floor being of an ornamental nature, and of bronze. The roof will be of hand-made tiles. The main entrance and staircase will be lined with marble and polished plaster. The demolition work is being carried out by Messrs. H. Sabey & Co., of 7, South Wharf, Paddington Basin, W.2. The architect is Sir Aston Webb, P.R.A., of 19, St. Anne's Gate, Westminster, S.W.1.

Regent-street.—The premises in Regent-street—Nos. 50, 52, and 54, occupied by the County Fire Office, and Messrs. W. Abbott & Co., Ltd.—at the corner of Glasshouse-street, W.1, are about to be rebuilt. Plans have been prepared for a new building of six stories, with shop frontages on the ground floor and offices above. The premises will be constructed of fireproof materials throughout, and will have an ornamental Portland stone front. The floors and main loads will be supported by a steel framework. The shop fronts will be of bronze, whilst the window casements will be of steel. Batteries of lifts, heating, lig ventilating, and vacuum cleaning installed. Plans have been prepared architects, Messrs. William Woodwar of 15, Great James-street, London, W Messrs. Ernest Newton (R.A.) & So Raymond's Buildings, Gray's Inn, W.C.1. The work of demolishing buildings on the site is being carrie Messrs. St. Mary's Wharf Cartage Smith Wharf, Paddington Basin, W

Kingsway.—New premises are bein Nos. 30—31, Great Queen-street, W.C.2, for the Royal Masonic Instit Girls. A building of five stories is constructed on a steel frame with land stone front and slated ro window casements will be of steel. modation will be provided for admi offices, halls, &c. The contractors a Allen Fairhead & Sons, of Sydney-road Middlesex. The demolition and e work has been carried out by Mr. Nel of Henshall-street, N.1. The steelwo erected by Messrs. H. Young & Co. Nine Elms Ironworks, S.E. The arch Messrs. Brown & Barrow, of Lenno Norfolk-street, London, W.C.2.

Whitcombe-street.—New premises erected in Whitcombe-street and square, W.1, for the Automobile As Ltd. A building of Portland stone, of t and basements, is planned, two stor contained in a mansard roof, and f above the main cornice. The buildin supported by a steel frame with floors, with a roof covered with gre The contractors are Messrs. Arthur Vi Knightsbridge, S.W.1, and the princ contractors :—Heating and ventilatin S. For rates of wages in the Building Trade in Scotland, see page 743.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

NORTHALLERTON.—Members of the All Saints' Parish Church have commenced a scheme for the erection of a new parochial hall, to cost approximately £3,000.

NORTH DUBLIN.—The R.D.C. has asked the Munster and Leinster Bank if they would loan £25,000 for the purpose of carrying out a new housing scheme.

NORTHFLEET.—Plans passed: House, London-road, Mrs. Knight; house, Wrotham-road, Mr. S. Bridger; workshops, High-street, Mr. B. Lingham.

NORTH WHITEFORD.—The R.D.C. passed plans: Two houses, Mr. H. M. Whitworth, Welches-dam; Mr. W. Fresher, bungalow, Ransonmoor.

OKEHAMPTON.—The R.D.C. has approved proposals for the erection of 46 houses.

OXFORD.—A new building is to be erected in Norham-gardens, Oxford, to provide accommodation for students at the Lady Margaret Hall. Of three stories, the new block will contain rooms for 40–60 students, dining and recreation rooms, kitchens, offices, &c., and will be constructed of local brick on a steel framework, with stone dressings. The roof will be tiled. The floors will be of fireproof construction, and a central heating apparatus and electric light will be installed throughout. The contractors are Messrs. J. A. Hunt (Hoddesdon), Ltd., of High-street, Hoddesdon, Herts. The architect is Sir Reginald Blomfield, A.R.A., of 1, New Court, Temple, E.C.4.

PENARTH.—Sanction has been given by the M.H. for the immediate erection of the following: Twenty houses at Llandough, for the Penarth Mutual Housing Society, Ltd.; 25 houses at Comerswell-road, for the G.W.R. (Penarth) Employees Building Society; caretaker's house at the Penarth Athletic grounds. The U.D.C. is to build 30 terrace houses at Cogan. The Council has received sanction to proceed with the layout of sea-front gardens at an estimated cost of £2,000.—Tenders are to be invited for the rebuilding and extension of the pier landing stage, for the U.D.C. The Council has applied for sanction to the borrowing of £14,500 for housing purposes.

PENYBONT.—The R.D.C. is to apply for sanction to erect an additional 24 houses at Pencoed.

RAWMARSH.—The M.H. held an inquiry into the U.D.C.'s application for sanction to borrow an amount not exceeding £14,000, in addition to a sum of £8,000 to be contributed by the Miners' Welfare Committee for the provision of public baths.

RIPON.—The T.C. confirmed a recommendation for the erection of a block of eight houses in Bondgate. The Town Clerk has applied to the M.H. for their approval and sanction to the borrowing of £20,000.

SALFORD.—The T.C. approved the following plans: Two semi-detached houses at Broom-lane, Broughton; two semi-detached houses at Cavendish-road, Broughton; house at Doveleys-road, Pendleton; two semi-detached houses at Lancaster-road, Pendleton; transformer sub-station at junction of Weaste-road South and Hassall-street, Pendleton.

SHIPLEY (YORKS.).—The Surveyor has prepared plans and estimates for the provision of a smallpox hospital at Heaton Royds; the estimated cost is £5,600, and application for sanction to borrow is being made to the M.H. A lay-out plan for 196 houses proposed to be erected on the Albert-road site has been approved by the Council.

SPALDING.—After considering various sites for the proposed Lincolnshire sugar beet factory, Spalding has been selected. The Anglo-Scottish Sugar Beet Corporation, Ltd., has just announced that about £300,000 will be spent on the work.

STOCKTON.—The R.D.C. has approved a plan for the erection of four cottages in Crook-street, Norton, for the London & North-Eastern Rly. Co. Cottage Homes and Benefit Fund.

SURREY.—The E.C. of the C.C. have on hand a big programme for the provision of additional facilities for secondary education in different parts of the county. The estimated cost of sites and buildings regarded as urgently necessary at present is, approximately, £220,000.

TAUNTON.—The Borough Surveyor of the T.C. has been instructed to prepare a plan and estimate of cost of the alteration of the swimming pool at French Weir.

THETFORD.—The T.C.'s Borough Surveyor is to carry out, by direct labour, alteration and additions to the hospital buildings.

THRAPSTON.—Northampton County E.C. is purchasing land for a proposed secondary school.

TORQUAY.—A large residence with about 20 acres of land has been acquired by Messrs. Spiers & Ponds, Ltd., the well-known caterers. It is proposed, as soon as building prices permit, to erect a palatial hotel, with several hundred rooms. The new building will embrace all modern improvements in hotel design, and will involve a considerable expenditure. The staff architect to Messrs. Spiers & Pond, Ltd., is Mr. J. Martin, A.R.I.B.A., of the company's headquarters at New Bridge-street, London, E.C.4.

TOTTENHAM.—The D.C. approved plans: Thirty-five houses in Elm Park-avenue, Lealand-road and Ferndale-road, for the S.M.H. Co.; 18 houses, in Downhills Park-road, for Messrs. Rowley Bros.; five houses Higham-road, for T. Snell.

TROON.—The Dean of Guild Court passed plans for buildings estimated to cost £11,750, as follows: Troon Pavilion Co., picture house in Templehill, and other linings for the erection of semi-villas and houses of the bungalow type in Logan-drive.

UPMINSTER.—The P.C. has received sanction for the purchase of Clock House for Council offices. The Public Works Loan Board has granted £2,000 to enable the Council to make the purchase.

WAYLAND.—The R.D.C. authorised the erection of the second four houses and are applying for a loan of £1,434.

WIMBLEDON.—Plans passed by the B.C.: Spiritualistic Church, Hartfield-road, for Mr. H. Jeffrey; house, Copse-hill, for Mr. R. W. Dibben; two houses, Devas-road, for Messrs. H. Coombs & Sons; house, Montana-road, for Messrs. W. H. Whitehead & Co.; house, Copse-hill, for Mr. McKay; house, Lauriston-road, for Messrs. Limpus & Son; house, Langham-road, for Messrs. Whitehead & Co.; four houses, Albany-road, for Mr. Browne: house, Wimbledon-hill, for Mr. W. W. Gibbings.

TRADE NEWS

r is made to electric light users by mens and English Electric Lamp -39, Upper Thames-street, London, have brought out a new game, "Wizard Electric," and offer to any reader who applies to the epartment at the above address, d. stamp for postage, and mention- er.

eceived from Messrs. The Foamite o., Ltd., 24-26, Maddox-street, , W. 1, a brochure dealing with s fire-fighting appliances, irefoam, it states, protects every perty—from the private house to farm—and is effective upon fires cription. It is suitable for the offices, garages, cinemas, factories, distilleries, and oil-storage tanks. aim, absolutely neutral, and does even the most delicate fabrics. oncerning their installations are the booklets, "The Foamite em for Extinguishing Oil Fires," uishing Oil Fires on Board Ship," sent upon application.

v Lincolnshire Factory.

r-beet factory is to be built at th Lincolnshire, by the Anglo- Beet Corporation, Ltd., at an st of £300,000. The site selected irts of the town between a tidal atercourse, and building is to be ortly.

ord Bricklaying Classes.

wn Council recently adopted a working class houses, of which built by direct labour and the enterprise. As this scheme will ilable building trade labour in the ord Technical Institute proposes g classes for teaching practical plastering.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Greenock.—HALL.—The Dean of Guild Court has passed plans for a new hall for the Salvation Army to be erected at the corner of Holmscroft-street and Duncan-street. The building will be two stories high.

Hawkhead.—INSTITUTE.—The Local District Board of Control has passed plans for a new institute for mental defectives at Hawkhead. The estimated cost is £92,537. The plans were prepared by Messrs. Abercrombie & Maitland, architects, Paisley. The building has been designed to accommodate 100 patients, and, if necessary, an extension can be arranged for a total accommodation of 500.

Stanley.—HALL.—It is proposed to lengthen Stanley Temperance Hall by 12 to 14 ft., to add a large ante-room, to re-model the present ante-room, to provide sanitary accommodation, and to relay the flooring.

GLASGOW SLUM CLEARANCE

THE Glasgow Corporation Housing Committee recently projected a scheme for the clearance of slums and the erection of new houses. The houses comprised in the scheme prepared by the Medical Officer recommends that 3,976 houses should be dealt with. Of these, 530 dwellings are situated in the Central Division of the city, 1,082 in the Northern, 1,405 in the Eastern, 463 in the South-Eastern, and 496 in the South-Western divisions. In all 453 "lands" or tenements are involved, 286 being front lands and 167 back lands. These include 1,996 one-apartment houses, 1,798 of two-apartment houses, and 182 houses of three and more apartments.

The inhabitants of these dwellings number 16,246, and for their future accommodation it is proposed to provide new dwellings situated elsewhere in the city. In all, 127 areas are involved in the suggested clearances, and of these areas the committee propose to reserve 87 that are mainly the sites of back "lands" for the purposes of open spaces, while 23 areas when cleared will be occupied by re-housing schemes, and the remaining 17 areas will be devoted to the erection of only business premises.

Bathgate.

It is reported that Mr. Marwick, of Edinburgh, has consented to act as assessor in a competition for designs for a technical school at Bathgate.

Scottish Architects.

The Incorporation of Architects in Scotland announce the following prizes and studentships for 1925:—(1) Howard Anderson Medal and £100 for a design for a central library for a provincial city; (2) Rutland Prize of £50 for the study of materials and construction; (3) Prizes of £10 to £15 for Third Year Students at the Schools of Architecture in Scotland. Pamphlet with conditions obtainable free from the Secretary, 15, Rutland-square, Edinburgh. At a recent monthly meeting of the Council a jury composed of the President and five Vice-Presidents was appointed to award the R.I.B.A. medal for street architecture throughout Scotland.

Steel Houses.

At a recent election meeting Councillor P. H. Allan said, with reference to housing, that they could do with 200 bricklayers, joiners, plasterers, plumbers, slaters, and masons at Canongate Ward, but they could not get them, and as a result the Town Council could not finish the houses which were being built at the present time. He had advocated that they should try steel houses for that reason. There was a complaint that they were dear, and he agreed. He would not advocate them if they could get the real thing, but it was necessary to try and solve the housing difficulty, and he considered they should be encouraged to proceed on any lines which would get houses.

Builder's Estate.

Mr. John Parker Appleton, of Oakdene, Anlaby Common, Anlaby, Yorks (net personalty £52), £5,083.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Plasterers' Masons' Labourers.

THE BUILDER

URNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. 4267. NOVEMBER 14, 1924.

ACTIONS AND REACTIONS

, production, and prices are the three factors of industry. The vital interests of the workers of the world are absolutely up in the stabilisation of wages on the sure and certain basis of money's worth. They are entitled to every penny they ey are not entitled to, and can never permanently secure, one farthing more."—W. M. COLLES, in the *Fortnightly Review*.]

RE is a popular detective story by "Sapper" sed upon the economic law dealing with supply d demand. We are introduced to the diamond agnate who controls the market, on the principle at the smaller the supply of diamonds the greater . A scientist discovers how to make diamonds so t a scullery maid can afford to wear a necklace of s large as tomatoes. The discovery must be kept orld at all costs, and it is here that the detective . This introduction holds a moral for the building lous and irrelevant as it may appear at first sight. ls are purchased because they are valuable, but they e because they are scarce. We, as a nation, have nited the supply of houses like diamonds, but we d their potential value—a fatal blunder from the int of view. When houses are as scarce as diamonds ar, but obviously they should possess an economic from their function in providing shelter for our the last few years we have destroyed the economic houses, with the result that we have to be content of them. We do not part company with our : the building trade has carried the process a stage limiting our supply we must be certain that the e will be paid. We refuse to pay the scarcity price and it is here that our analogy with the diamond us. Although we could not afford the price of individuals, public opinion forced us to build as With a sure and certain market in front of him, the ised his prices, and defying all the laws of political e demonstrated that scarcity values can be wrung on caught in an unfortunate dilemma.

cedure on the part of the workman is perfectly erstand; it is as obvious as it is elementary, but or its success upon too many artificial conditions. red a demand for houses from the State, it becomes estion of keeping intact a certain number of factors. n must be certain (1) that the demand is guaranteed erable period ahead; (2) that the supply can be stricting the number of men to be employed in the that there is only one particular method of building that only one particular trade can do the work. programme extending for fifteen years was the ffered by the Government, and the representatives ng industry in return completed the vicious circle by a large majority any proposals for absorbing and unskilled labour. The position was ripe for a wages, and taking into consideration the extra- umstances, and the fact that those responsible for f the building trade seemed to have chosen the it is quite conceivable that prices and wages been higher.

pect of a total annual loss, computed by Mr. ceed £60,000,000 on Mr. Wheatley's houses when uilt, may not have been overlooked by the building ought to have been only too obvious that it was duty of the State to examine every possible ducing this stupendous burden upon a country ly taxed.

always advocated that the building trade should own internal problems, and we urged that any ution should be controlled by the trade rather than by Government. Having refused to entertain the idea, the problem still remains that some other trade may deal with the housing shortage and the appalling number of unemployed. These two problems are serious and urgent, and both of them are putting a serious strain upon the financial resources of the country. It is both a natural and irresistible suggestion that every means should be tried to deal with both problems at the same time. In our view there is a call for sounder economics and more imagination than has hitherto been shown. We do not pretend to suggest a detailed housing policy; we submit that any scheme of housing—and with it the building trade—is bound to suffer the fate which will befall every attempt to suspend the laws of supply and demand. It is fairly evident that the public is beginning to realise that it may be subsidising inefficiency, instead of attacking the root of the trouble by increasing supply.

Lord Middleton and Lord Weir have put forward suggestions for auxiliary schemes of housing built on the mass production principle, with the minimum of skilled labour, and it is certain that public opinion will demand that these proposals should be carefully examined and that every encouragement and latitude should be given. In an age which has many wonderful inventions to its credit, it is idle to believe that there is only one method of building houses. The philosophy which distinguishes between realists and idealists may be wrong, or at least misleading, but between these two parties we have seen every housing scheme wrecked. We have seen the building trade entrenched in what was considered to be an impregnable position, and the social reformer clinging to his best debating points. The daily papers, heedless of our experience of war-time controls, persist in the delusion that they can do all that is necessary by detecting "rings" for us. They welcome the setting up of "a small committee to watch the prices of building materials, and keep the Government fully informed." Attention is drawn to these matters, and to the number of bricks which a bricklayer can reasonably be expected to lay in an hour, in much the same way that ability to read the barometer may create a desire to try and alter the weather.

In a national emergency of this nature, we are likely to find that the solution of our present difficulties will be found in a modification of our housing ideals which will admit of the adoption of less permanent building materials. We shall be sorry to see our traditional forms of building departing, but it is useless to apply the shibboleths of the past to the crisis of the present. We hold that no one can, in fairness, claim the monopoly of social or political idealism, and it is no more than a patent truism to say that the decisions of the building trade unions in the matter would have been the better for more of the earnestness and high purpose which should mark the activities of those who are commercially serviceable to their neighbours. We sympathise with the building trade in that its operations have been hindered and complicated for several years by a Government control, and we do not believe that any other industry under similar conditions would have acted differently or seen farther into the problem. Instead of drawing nearer to an economic balance between values and costs, the breach is widening, and the problem of housing is more serious, and the burden of carrying it is greater than ever. It is impossible to prophesy what the future holds, but it would be foolish to ignore the possibility that the result may be a permanent loss to the building industry.

NOTES.

The Late Sir T. G. Jackson, R.A.

We regret to have to record the death of Sir Thomas Graham Jackson, Bart., R.A., who lived to within about a year of 90. In the wonderful revival of modern architecture which followed the deadly dullness of the earlier half of the nineteenth century, the late T. G. Jackson played a conspicuously successful part, and much of his work was very markedly in the front rank of modern work during the earlier part of his practice. He was not a mere pedant or archæologist, and no servile follower of precedent; he was a thinker and a critic with a well furnished intellect. We cannot say that he rose to the level of the artistic attainment of the best of his compeers, but he has done much sound and excellent work, and certain of his college work in Cambridge is as good as any modern architect can show. He was an architect of great ability, and has done much to uphold the credit of modern architecture. His literary work has been both valuable and interesting, and we still recall the delight with which we hailed his books on Dalmatia. All his publications gained immensely by the vivid illustrations which he himself produced by pen and ink and wash, giving a reality of interest which no photographs could supply. It is to be hoped that the practice of architecture in this country may be followed by many who will achieve as fine a reputation for high endeavour as the late Thomas Graham Jackson.

Manchester New Art Gallery Competition.

An intending competitor in this competition writes: "It is to be regretted that the assessors in answering a protest against the onerous requirement of four elevations and two sections to an eighth scale adhere to the stipulation that all these plans and a half-inch detail should be 'rendered in monochrome.' The recent tendency to relieve competing architects of needless labour is thus reversed. Do the assessors imagine that the office staffs of practising architects use this academical and useless system of rendering in their daily work? Cannot some concession be made in the interests of the large number of competitors who will labour in vain by reducing labour which must be wasted." We agree with our correspondent and hope that some concession will be made.

The Prime Minister's Speech.

As we listened to the Prime Minister's speech on Monday night it came as a pleasant note to hear such an appreciative reference to the excellent books by Mr. Lethaby, the architect, from one of which Mr. Baldwin found some pertinent illustration to his remarks. We are not, of course, surprised that Mr. Lethaby's writing appeals to others outside a professional circle, but it would be well if the Prime Minister's allusions interest some who are unacquainted with Professor Lethaby's works, so that they may add to their stores of interest and pleasure.

Mr. Neville Chamberlain

The wheel has turned the complete circle and we find ourselves once again with Mr. Chamberlain as Minister of Health. It is to be hoped that constant changes of policy and personnel are at an end and that we are in for a prolonged period when a definite housing solution will be given a fair trial. Whatever may be said of Mr. Wheatley's scheme as a whole, he has certainly introduced one very necessary change; one that we sincerely hope will not be nullified by reactionary pressure upon the new Minister—we refer to the necessity for consulting the Ministry when an unusual number of houses to the acre is in contemplation.

e effect of that section. We have the decision in question, but we at doubts may be set at rest, y an early decision of the High hen by legislation confirming the decontrol furnished by the Rent 23. The Government has an y difficult task before it in on with the Housing Acts, and at sent moment the question of decontrol should take quite a place, and we should be the last for it, but until the effect of the Act is determined landlords are a position of difficulty in under- their position under the Act of

---

While making full allowance for the force of the cies. criticisms made by Sir Reginald Blomfield in a recent on certain tendencies in the art y and the worship of strange s more difficult to be just to the e which lies between personal d the forms of nature. Realism rection and reaction in another— ralistic painter and the emulator ast have together led to a rejec- oth by those who missed the life either. As a consequence, this too far, and has produced ex- a morbid character, as in the an Gogh. But we should not be his into reaction ourselves, and the lecturer in his address failed up the further consideration of ect which would have thrown ght on it. We see in the some of the new primitives an each beauty at first hand, rid of en of past knowledge, and the of preconceived styles. It is spirit which shapes art, not , though authority is included in it. A new spring time, such as the present, will not reveal the ripeness of harvest, but we believe that there is a sowing of the ground of more promise than perhaps the lecturer perceives. We must allow for the difficulties of the time when art has so much to build its house anew—on tradition, no doubt—but not on the falsification so often mistaken for it.

County Hall Art.

The proposal of the L.C.C. to invoke the aid of men eminent in the world of art to act as an advisory Committee to deal with the proposals to decorate the County Hall is of much interest, and we are glad to know that they are not prepared to accept any and every offer of statuary, paintings and the like which may be made to the Council. We have the example of the Royal Exchange to caution us against this piecemeal method of proceeding. It appears to us that the first requirement in any such enterprise is to prepare a scheme for the decoration as a whole, a scheme so co-ordinated that every contribution offered should help towards the realisation of the scheme thus prepared. Is it not possible to invite a limited number of schemes dealing with the decoration as a whole in order that the same unity which we expect to find in an architectural building may be included in the decorations of it. We shall succeed so much better when this more intelligent forethought anticipates the execution of internal decoration.

Technical Training.

We watched but recently a stone mason occupied in carving a capital to a pilaster which showed complete knowledge of the handling of his material, but the result also showed that the knowledge he possessed of working in the material had provided him with no capacity to make any desirable use of it, for the artistry was deplorable. The present exaggeration of craft ideals and all the loose and theoretic talk about it has led us to forget that it is the least part of art that can be learned, and that we have done but little when we have trained the hand, and that there is much truth in the dictum of Thomas Carlyle in speaking of his own craft, that if a man has something important to say he will generally find the means of saying it. When we have more trust in the inspiration of life we shall put the emphasis in the right place, and when we do our views on art training will be strangely altered.

Admission to Picture Exhibitions.

A correspondent asks why a fee of a shilling or so is generally charged for admission to a gallery where pictures are exhibited for sale, "whereas he can admire works of art in a shop or store or our famous salerooms for nothing." No doubt a charge for admission is made in order to keep out people who would go in simply to look at the pictures with no intention of buying, but there is probably much in the idea of the big stores who invite all and sundry to make a rendezvous of their premises in the hope that while there they will see something they need or that attracts them, and become customers in spite of their original intention of not purchasing anything.

Possible Legislation.

How easy it would be now to create a popular government, says a correspondent. "Give us back our penny postage, remove the restrictions that prevent the employment of the unemployed (so much due to Trade Union restrictions) and finally reduce the income tax." Who knows whether the signs of trade activity to be seen on all hands do not justify so bold a policy.

GENERAL NEWS

Professional Announcements.

Messrs. Chesterton & Sons have removed to new offices on the first floor at 79, Queen-street, Cheapside, E.C.4.

Messrs. Smee & Houchin, architects and surveyors, have removed to "Fleet House," 58, Fleet-street, London, E.C.4.

Obituary.

The death occurred recently of Mr. D. O. M. Roberts, M.S.A., architect, Portmadoc, of the firm of Messrs. O. M. Roberts & Son, Portmadoc, at the age of 58.

Abandoned Development Scheme.

The Ford Motor Company have officially informed the Southampton Corporation that they have abandoned their scheme to erect factories and works on the River Test.

Dover War Memorial.

The unveiling of the Dover War Memorial was performed recently by Vice-Admiral Sir Roger Keyes. The memorial consists of a central pedestal and two low wing walls mounted on a plinth some 18 in. in height, the whole forming a solid base of grey Cornish granite about 15 ft. in length. The sculptor was Mr. R. R. Goulden, of London.

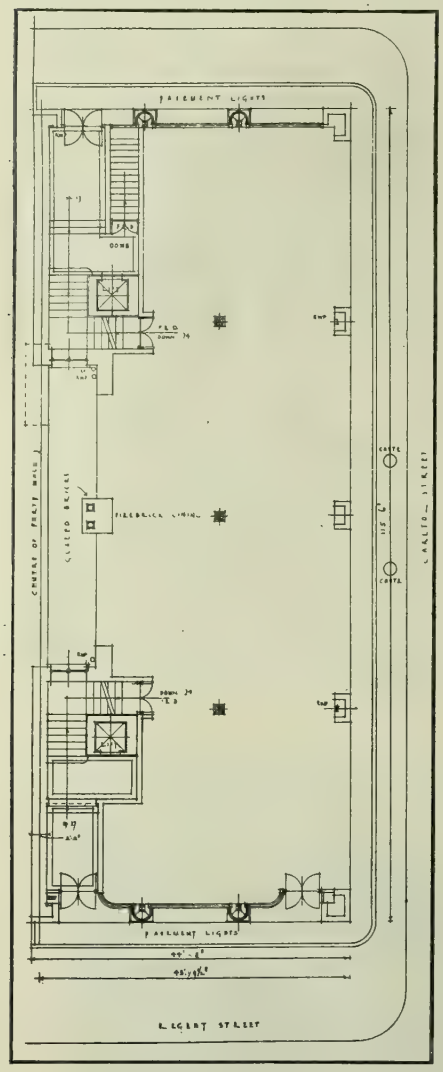
Lancaster War Memorial.

The memorial to the men of the King's Own Royal Regiment (Lancaster) in the King's Own Memorial Chapel in Lancaster Parish Church was recently completed. It is in the form of a stained-glass west window in the chapel, and a roll of honour to be placed in a carved oak shrine beneath. The shrine was designed by the architects of the chapel, Messrs. Austin and Paley, of Lancaster.

Royal Society of Arts.

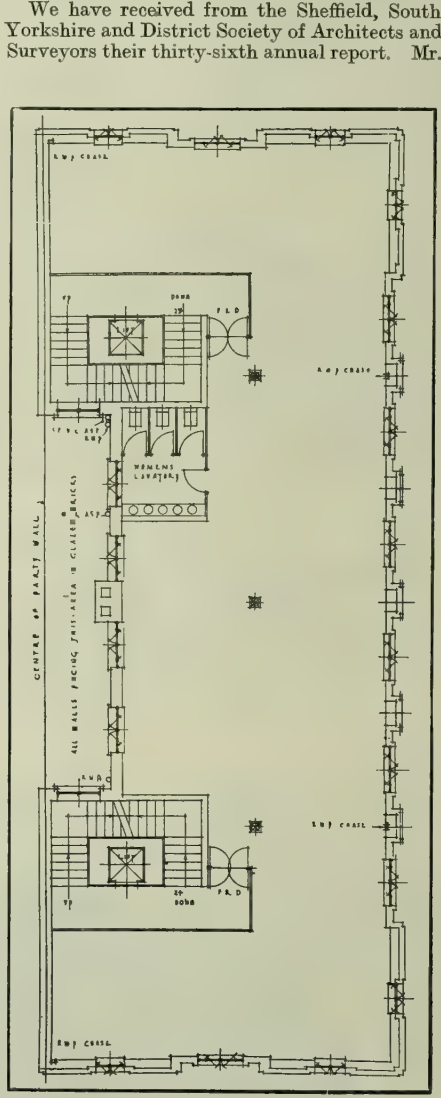
Under the Peter Le Neve Foster Trust the Council offer a prize of £25 for an essay on "The Effect of Trade Union Regulations on Industrial Output." Intending competitors must send in their essays not later than March 31, 1925, to the Secretary, Royal Society of Arts, John-street, Adelphi, London, W.C.2. The essays must be typed or clearly written. They may be sent in under the author's name, or under a motto, accompanied by a sealed envelope enclosing the name, as preferred.

Sheffield Society of Architects and Surveyors.



We have received from the Sheffield, South Yorkshire and District Society of Architects and Surveyors their thirty-sixth annual report. Mr. H. L. Paterson, F.R.I.B.A., is Preside session 1924–5, and the Report states April the total membership was as One Honorary Member, 25 Fellows, ciates, 2 Students and 6 Lay Member a total of 80, as against 77 last year. given in the Report of a valuable series read during the last session.

Ex-Service Vacancies.



We are informed that a limited n vacancies for male officers in the pri Borstal Institutions will be filled d course of the next few months. Cand is stated, should be not more than 35 age, and must have served with the the War. Men of character and pe with good health and physique, are The selected candidates will be those education, training, and temperamen fitted to take part in the difficult work o offenders for citizenship. Knowledge if thorough, will be an additional reaso sideration. Particulars of pay and co with application form, will be forw application to the Secretary, Prison Co Home Office, S.W.1.

A Margate Improvement.

Sir Anker Simmons, K.B.E., Offic trator under the Acquisition of Land (A of Compensation) Act, 1919, has is award in a claim by Mr. Francis Mars against the Mayor, Aldermen and Bu the Borough of Margate, acting by th of the Borough, concerning the Council tion of vacant land on the west side of High-street, for the purpose of setting frontage. The award is as follows:— Acquiring Authority to pay the owner pensation in respect of his freehold in the land the sum of £188 15s. (2) The Authority to remove the existing wall boundary fence, retaining the wall mate leaving carefully stacked the iron fen gate for the use of the claimant, to whom a further sum of £44 towards the cost of within six months, to the satisfactio Acquiring Authority, a suitable bounda with gate, on the new line of boundary a by the existing fences. (3) The Authority to pay the fees on this (4) Each party to pay its own costs.

GROUND FLOOR PLAN.

1ST, 2ND, 3RD AND 4TH FLOOR PLANS.

Dorland House, Regent-street. MR. J. J. JOASS, F.R.I.B.A., Architect.

The top floor of this building with light on each side, and top light, would be particularly suitable for accommodation for an architect or engineering draughtsman. The contractor is Mr. F. G. Minter, Putney, and among the sub-contractors are: Steelwork, Messrs. Moreland, Hayne & Co., Ltd.; floors and roofs, Messrs. The Kleine Patent Fire Resisting Flooring Syndicate, Ltd.; casements, Messrs. The Crittall Manufacturing Co., Ltd.; asphalte, Messrs. Lawford & Co.; sanitary fittings, Messrs. Shanks & Co., Ltd.; radiators, Messrs. The National Radiator Co.; lead castings, Messrs. H. H. Martyn & Co., Ltd.; pavement lights, Messrs. J. A. King & Co.

COMPETITION NE

Glasgow High School Memoria

The assessor, Mr. John Keppie, F. has made the following award in this tion out of the fourteen designs sent in Mr. Alex. Cullen, A.R.I.B.A., 88, street, Hamilton; (2) £100, Mr. W. I I.A., 131, West Regent-street, Glasgow Mr. J. A. Wilson, I.A., 92, Bath-street,

Southend School.

Designs are invited for the erection Senior Elementary (Intermediate) Westcliff. Premiums of one hundred, five, and fifty guineas, are offered res The assessor is Mr. J. W. Fisher, F.R. Wellingborough. Details can be had cation to the Education Offices, 20, square, Southend-on-Sea, not la December 10.

Other Competitions.

Other competitions still open in following (the dates given are, first the date, and second the issue of *The* which full particulars were given): Hall (May 1). Manchester Art Gallery Aug. 22). Essays on Ventilation (no in day announced; Oct. 31). Vall oct (June 30, 1925; Oct. 31). Office bi (Feb. 28, 1925; Nov. 7). Barrow —banned by R.I.B.A. (no sending Nov. 7). Jugo-Slav Landscape (Nov. 7). Church at Southport (no date; Nov. 7).

Dorland House, Regent-street.

MR. J. J. JOASS, F.R.I.B.A., Architect.

PRESIDENTIAL ADDRESS.

MR. A. J. TAYLOR (President) delivered his presidential address before the Society of Architects, No. 28, Bedford-square, W.C.2, yesterday (Thursday).

After referring to the work of the immediate Past President, Mr. E. J. Partridge, in the negotiations with the R.I.B.A., which resulted in the amalgamation agreement, and to whom, he said, the thanks of the Society were due for the tactful and firm manner in which he had handled the work entrusted to him by its members, he dealt with the amalgamation with the R.I.B.A.

Amalgamation with the R.I.B.A., he said, was not sought by the Society as such, but the Society very gladly availed itself of the renewed invitation of the R.I.B.A. to discuss the registration question with them, and eventually agreed to amalgamation as a means to an end, viz., registration, and it was certain that the disappearance of the Society would be received by its members and by the profession generally with a good deal of regret; and that not from a sentimental, but from a practical standpoint, because there was no doubt that had the Society not taken the lead in many instances in professional reforms, and kept things going, a good deal of the progress which had been made during the past few years would not have been accomplished, at any rate so rapidly.

It seemed clear, from a public reference to the subject by the President of the R.I.B.A., that it was only a question of time before the actual machinery of amalgamation would commence to function, and that for all practical purposes the amalgamation had taken place. What they had to consider now was their future personal relations with the Institute to which they would presently transfer themselves. Although the Society as a separate entity would drop out of the race, it would, under the amalgamation scheme, hand on the torch to the Institute, which body, he was convinced from personal contact with its leading members, was genuinely desirous of carrying on the Society's educational work and scholarships, &c., and also was very much in earnest in proceeding with the registration proposals, in connection with which a joint registration committee was formed immediately the agreement was settled. He could assure the Institute that it was the intention of the Society individually and collectively when they transferred to give it the same loyal and active support which they were giving to the Society. If they did that, then those who feared that after amalgamation progress in the direction of attempting registration and other reforms would not proceed so rapidly as they would wish, would prove happily mistaken; or if there were any apparent lack of initiative in the new Institute it would be due to the fact that the ex-members of the Society had not availed themselves of their corporate privileges in taking that active part in the work and government of the Institute which it would be within their power to do under the new supplemental Charter and revised by-laws.

The Council was now engaged on a scheme for the disposal of the Society's assets for the consideration of the general body of members, and he was merely expressing his personal view in anticipating that they would have no wish to do otherwise than transfer it to the care of that body with which they were about to be amalgamated, it might be pointed out that such a course would merely be transferring the members' possessions from one pocket to another, because as members of the Institute they would retain their interest in its property and the way it was administered. There was no doubt that the Society's premises would form an extremely valuable addition to the Institute's possessions for meeting its extended activities and needs after amalgamation, and might well form the headquarters of the joint registration committee. For all practical purposes it seemed there was a reasonable possibility that to all outward appearance there would be, or need be, very little change in the present arrangements, and that what would happen would be that the members of the Institute would have two addresses instead of one until such time as the Institute grew too large to be housed either in Conduit-street or Bedford-square, or both, and an entirely new headquarters of the architectural profession became necessary.

Something had been heard of the labours of the Society's Negotiating Committee in connection with the amalgamation scheme, but the bulk of the work in the preparation of the details of the Society's protective clauses, counter suggestions and the adjustment of innumerable small but essential points necessarily fell upon the Secretary, Mr. McArthur Butler, to whom he felt they were all greatly indebted for the way in which he had discharged the very responsible duties entrusted to him.

MUNICIPAL RECREATION

MR. WILLIAM HAYWOOD, F.R.I.B.A., in his fifth lecture at Birmingham University on town planning, said an adequate provision for municipal recreation was not usually found in town-planning schemes for English cities, but in the gardenless, tenemented areas of America, municipal responsibility for community recreation had been accepted for more than thirty years. No American town plan was thought complete without an allocation of recreation facilities within easy reach of all citizens; indeed, a carefully-worked-out "Park system" (upon which city recreation was based) was all the town plan many American cities possessed.

In some respects the English need had been less than that of the United States. There were probably no towns in this country, for instance, where it was necessary to prohibit traffic in certain streets during a part of each day, in order to make some provision—however inadequate—for children to play in safety near to their homes. They had comparatively few tenements, and little need for drastic action of this kind.

But the pressure was felt in other directions. With more leisure, their people now took their recreation more systematically. There was a great demand for special accommodation for the larger ball games, and in Birmingham, within the last twenty years, 350 acres of land had been acquired and set apart for this purpose. During the same period the acreage of their suburban parks had been increased by over 600 acres, and all such parks were used almost to excess for cricket, tennis, and bowls. They had 475 acres at the Lickey Hills as a nature reservation for rambling, and the total area of land now available for public recreation in the city was no less than 2,566 acres.

They had made little progress, however, in two important aspects of American practice, viz., the linking together of suburban parks by means of parkways; and the provision of neighbourhood centres and childrens' playgrounds. They had no parkways; but these, although important, were not urgent. Playgrounds in the built-up parts of the city were initiated by Mr. Norman Chamberlain before the war, but were now disorganised; and it was only within the last few years that a start had been made with neighbourhood centres in Birmingham. The outdoor appurtenances of a neighbourhood centre were in full use at Muntz Park; and it was hoped that indoor accommodation would be available at this centre before long. There were some prospects, too, of a similar centre at the Henburys; and the need for a co-ordinated programme of recreation for the systematic equipment of the whole city, and especially of its congested central areas, was now under consideration. So that it might be said of Birmingham that it was definitely moving towards a wider policy in municipal recreation.

GEOGRAPHY AN ARCHITECTURE

SIR BANISTER FLETCHER lectured r the Central School of Arts and Crafts on tecture of Italy, referring to the Goth and more particularly of Northern Ita he said, many influences affected th The classical remains in that country the Roman tradition in design, and t style never took root there, except and other places in the north, where influence was sometimes apparent. Eastern influence, *via* the Mediterra produced a Byzantine element. Sir showed lantern slides of S. Petronio, with its interesting unfinished fron Antonio, Padua, with its incongruou SS. Woodblocks for Schools.

The London County Council Educe mittee recently reported in favour pine wood-block flooring instead flooring being used in the halls and new, rebuilt and remodelled elementa The additional cost involved in wood-block flooring instead of board in both halls and corridors of an av school, is estimated at £268, or, if are dealt with, the additional cost about £168.

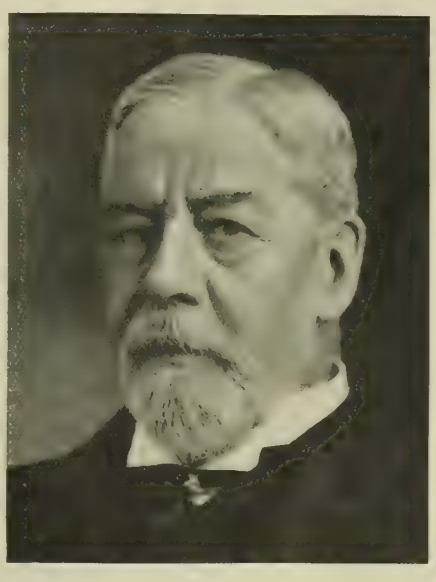
SIR T. G. JACKSON, BART., R.A.

By PROFESSOR BERESFORD PITE, M.A., F.R.I.B.A.

ath of Sir Thos. Jackson in his eighty-ar, removes a dignified figure and a l mind from the ranks of the profession. e remembered for the consistency of tecture and honoured by a reputation rship and high-mindedness, which we elieve he would have valued most.

s a type almost by himself, funda- an English gentleman, and an Oxonian, Fellow of Wadham, the college of d an architectural practitioner who ck upon his professional education, by ethod of pupilage to a great man, as and satisfactory. He was a product -gone school of devoted enthusiasm to f historic art, and it was interesting to this outlook on architecture persisted t his practising life, and only seemed n as in later years his literary labours nwards from Byzantine through Gothic ssance history. But having at the ntracted the new enthusiasm for the pised English Renaissance, he more ne else delivered it from the invidious- ts current description as "debased," istently adhered to this first attach- affected by the still rolling tide of ral fickleness. A certain lack of on kept him faithful to a narrow path, ad the satisfaction in his particular operation of proving that consistency stablishes an architect's reputation as spasmodic genius.

look was sound, though tending to be and desirious to be reasonable he was is judgments. He was always cool in towards student-like experiments, neither swayed by essentially Greek eval notions, or by modern ideas of He once remarked that it was not d letting students work at Greek Doric man or Tuscan form was more likely seful. His wide practice gave him, , an authoritative position which his judgment from hesitation or



Jackson belonged to the honoured but ng race of architects who draw their lings in perspective; he had been in rt Scott's nest of draughtsmen; his nk drawings were always nervous and g, they never wanted style, and his our sketches evidenced his enjoyment ecreation of architectural youth.

mpetition for the new examination Oxford in the late 'seventies was his ion to the world. If Norman Shaw, tic work, made the running with ne, Jackson's Jacobean led the way in building from that time until Georgian d. The Examination Schools, his ins his most important work. It still eshness in spite of much hackneyed based upon careful study of examples, Burleigh seems apparent, its qualities h of design and interest of detail was, and continues a landmark in t of the late nineteenth century.

ius of Oxford had been seized by her he archæological flavour, which has disastrously popular, was imparted he first time to a prominent public in a favourable atmosphere. The s set and pursued with such effect inguished Oxonian said that the City rebuilt in the "Anglo-Jackson style." ny additions to colleges and public ldings designed by Jackson were all y a rule of harmony with the seven- ntury, and the odd phantasies of workmen were extended by the solemn his scholarship. Difficulty only arose prescription had to be applied to n a differing scale, and for such s laboratories and museums; but, that the problem was completely of treatment by precedent, Jackson's of Jacobean seldom failed.

The large block of museum and library buildings at Cambridge was built about 30 years later. In spite of some prominent anachronisms, next to the Oxford Schools it may be judged to be his most successful work. The architect wrestles characteristically with its purpose, it attains real dignity, and the detail is expressive. One is made conscious that it is the work of a man who has felt his building and has imparted to it somewhat of his own dignity of ideal.

Jackson seldom entered for architectural competitions, but it is interesting to recall two designs which illustrate his outlook when Jacobean would not avail. As one of the nominated competitors, he submitted a design for the Imperial Institute in 1887, which echoed the Low Countries; the lofty bell tower and Flemish treatment coming nearest to his usual school. An interesting design in modern Russian Byzantine was submitted in competition for the memorial church at St. Petersburg to the murdered Czar Alexander; this reflects Jackson's early acquaintance with the architecture of the Near East.

The late Sir T. G. Jackson, Bart, R.A.

Ecclesiastical work came naturally to a pupil of Scott. Jackson's churches were usually in the later Gothic manner, and were sound, if uninspiring. The School Chapel at Giggleswick, with its dome, involving difficult acoustics, was a compulsory experiment that has the interest of peculiarity. The restoration of the walls of Winchester Cathedral to the vertical, and of the statuary of St. Mary's Tower at Oxford were works of difficulty, full of opportunity for criticism. The confidence of the authorities in each case fortified the architect, though it could not satisfy all his friends.

In London Mr. Athelstan Riley's house at Kensington Court, with its Flemish front facing the Park, is the best known of Jackson's buildings; it was elaborately detailed and belongs to the early days of his connection with the Arts and Crafts movement. It possesses a Jacobean grand pianoforte case designed by him and painted by Burne-Jones—a restrained and beautiful work.

In his later years Jackson's scholarly mind and extraordinary industry produced a series of architectural histories of which full account must be taken in estimating his life work.

In 1873 he published a small octavo volume on "Modern Gothic Architecture," which revealed his dissatisfaction with the results of the Revival.

Travels in the Adriatic produced a series o interesting studies. A paper on Ragusa, written in Italian, was produced for a Dalmatian annual in 1885. Two years later, an important book in three volumes on "Dalmatia, the Quarnero and Istria," illustrated with his own drawings; and a sessional paper at the R.I.B.A. on the subject. In 1893, a very full and pious history of his own College of Wadham; and in 1897 a history of St. Mary the Virgin, Oxford, an indirect apology for its restoration, with photographs of the ancient statues and of their successors by Sir Geo. Frampton. In 1892 appeared "Architecture: a Profession or an Art," of which he was co-editor. In 1898, a sessional paper was contributed on "Mediæval Libraries of Great Writers."

The series of architectural histories began in 1913 with "Byzantine and Romanesque," in two volumes, the most important of his works; followed in 1915 by "Gothic Architecture in France and Italy," in two volumes.

In 1917 came a holiday volume on Umbria. The histories resumed with the "Renaissance of Roman Architecture, Italy," in 1921; "England," in 1922; and "France," in 1923. These works are, of course, well written and pleasantly illustrated by his own and his son's drawings and photographs, but their permanent value as adequate to their subjects remains to be examined. A sense of affection for the enthusiasm and industry of the author controls our judgment. They have the evidences of artistic sensibility and of the partialities of an Englishman whose confidence of outlook was characteristic. One wonders what the effect on the author's practice would have been had this wider field of vision opened to him in earlier days.

Sir Thos. Jackson belonged to the once important group of able architects who cherished a repugnance to alliance with the Institute, on grounds that were not easily understood. When others gave way in this matter he stood firm. The main reason was perhaps a nervous fear of professionalism—his editorship with Norman Shaw of the volume of essays, entitled "Architecture: a Profession or an Art," illustrated a point of view which was then theoretical but now has practical bearing. But Jackson was never unfriendly; he occasionally contributed papers and attended meetings and accepted the Royal Gold Medal in 1910. Outside the charmed circle of the Royal Academy elect he was little known, apart from his works to architects; but his brethren by profession always confessed that respect, which often deepens into affection, for a consistent worker who never derogated from his own high standard in architecture, and who preserved a scholarly outlook and the high reputation of a Christian gentleman and artist.

Sir Thomas, amongst other work, was responsible for the new Radcliffe Library and additions to Brasenose, Lincoln, Balliol, Trinity, Hertford, and Corpus Christi Colleges, he restored St. Mary's and All Saints' Churches, and planned the City High School and the High School for Girls. Cambridge owes to him the Sedgwick Museum, the Law Schools, and Library and laboratories. He also designed much for public schools—Eton, Westminster, Rugby, Harrow, Christ's Hospital, and many lesser schools, including his own, Brighton College. Sir Thomas was associated with Sir Francis Fox, the engineer, in the strengthening and restoring of the foundations and the superstructure of Winchester Cathedral, and in London his work, although rare, is to be seen at Draper's Hall and the Inner Temple. He designed but few churches; Annesley, in Nottinghamshire, in 1873, and St. Augustine's, Wimbledon, in 1907, are early and late examples. He has also left few private houses.

He was a D.C.L. of Oxford, LL.D. of Cambridge, an Associate of the Royal Academy of Belgium, a Past Master of the Art Workers' Guild, and a Fellow of the Society of Antiquaries. Sir Thomas was left a widower in 1900, with two sons, the elder of whom, Captain Hugh Nicholas Jackson, of the R.F.A., who was born in 1881, succeeds to the baronetcy.

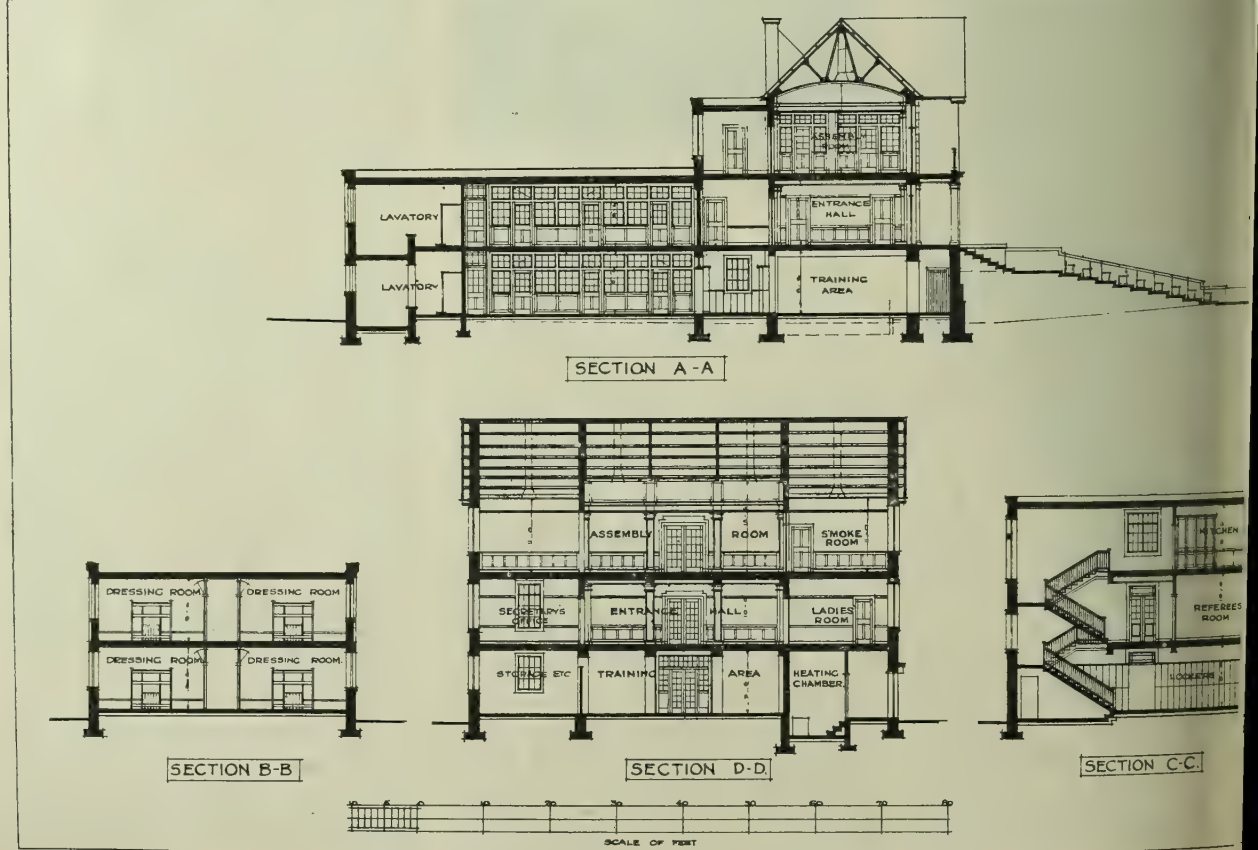
THE GLASGOW HIGH SCHOOL COMPETITION

THIS competition for a club house and pavilion at Anniesland provides one more example of the growing recognition of the importance of athletics in the development of the nation's future manhood, and it is but fitting that the Glasgow High School, which occupies a pre-eminent position in both the scholastic and athletic life in the West of Scotland, should lead the way.

The assessor in the competition was Mr. John Keppie, A.R.S.A., F.R.I.B.A., and his decision was as follows:—(1) Mr. Alex. Cullen, A.R.I.B.A., 88, Cadzow-street, Hamilton; (2) Mr. W. H. Howie, I.A., 131, West Regent-street, Glasgow; (3) Mr. J. Archd. Wilson, I.A., 92, Bath-street, Glasgow.

The winning design is certainly the best of the fourteen schemes submitted, unnecessary expenditure being cut down to a minimum without loss of the essential dignity and substance which such a structure should possess. The approaches to the ground have been very carefully worked out in relation to the pavilion, a segmental entrance area being provided. This will certainly contribute to the avoidance of congestion on the main road on the occasion of crowded gatherings. In planning the building the author has made fair use of the existing ground level; at the same time nothing is lost in the way of suitable placing in relation to the playing fields, the western front commanding an uninterrupted view of the whole. The pavilion terracing is approached by flights of steps on both north and south sides of the club house, whilst a central flight leads to the main floor. A members' entrance to the terracing is also provided. The front part of the building facing the fields contains a substantial entrance hall, flanked by the secretary's office and ladies' room respectively, while on a lower ground floor below the terrace level a training centre with auxiliary dressing-room and the heating chamber are shown. The rear wing is devoted to dressing and washing accommodation on upper and lower floors, providing two complete units. Direct access to the field is provided for the latter. The plan as a whole is well balanced and symmetrical, this being justified by a sympathetic treatment in the elevations. These are of a restrained and simple character and contain no feature likely to deteriorate quickly through the action of the weather or suggestive of the "temporary pavilion" type of design so commonly met with in this connection. Brick cavity walls are proposed with roughcast exterior, while stone dressings mark the principal features of the front portion of the building. The roof over the main part is carried on steel principals and is intended to be slated. The remaining roofs over the dressing-room and lavatory wing, and over the staircase and kitchen, are to be of concrete reinforced with steel wire lattice and covered with asphalt. Metal windows are provided throughout. The floors are of reinforced concrete, covered with wood blocks in the entrance hall, terrazzo in the lavatories, and wood flooring in narrow breadths on runners in the remainder. Electric lighting will be easily supplied from an existing cable in the main road, and heating and ventilation are dealt with by means of the low pressure hot-water system in the first case, and by the natural system in the latter, use being made of direct acting ventilato invisible roof type over the assemb The hot water arrangements have b fully thought out with a view to r the supply to immediate requireme thus saving fuel. The estimated co design is placed at £8,576.

The design placed second has elaborate treatment in the elevations terior being intended to have a whit finish. The plan, although not unlike design in general arrangement, is and a feature is made of the main sta is shown in the elevation as a squa which is not of sufficient height to the main portion of the building, a what loses its value as an external f consequence. A well-lit and ventilate bly hall is a good feature of this The estimated cost is £7,734.



The third premiated design is pl a rectangle with the main front fac west. A pleasing treatment in the el somewhat marred by the relationsh lower wing to the main building, wh perhaps not appear so happily place perspective sketch would seem to ind

The remainder of the designs s show a great deal of careful thou usually effect is gained at the expen utility of the plan, while prohibi would certainly rule out some whos have placed their estimates rather lo

SECURITY FOR PRIVATE BUILDING

In a recent letter to the *Times*, Mr. John Murray, F.R.I.B.A., writes :—

"With the advent of a new Government we are reminded that no real solution of the housing question has yet been formulated. I therefore, *pro bono publico*, venture to offer a few suggestions, which, if tried, might, I think, go far towards a solution.

"(1) The problem is primarily a financial one, and if this aspect of it were solved satisfactorily, I think adequate designs, materials, and labour at reasonable cost would soon be forthcoming, and produce speedily the requisite dwellings at fair rents.

"(2) No really satisfactory solution can, however, be attained unless finance is justly treated and assisted by sufficient credit and security.

"(3) Government control of rents and subsidies should be discontinued as soon as possible, Government aid for building substituted, and private enterprise should be given a free hand, thus producing general competition.

"(4) The Government could aid sufficiently by merely guaranteeing the interest (not the capital), upon all mortgage money advanced by anyone to building owners upon the security of approved houses, flats, and housing schemes, and let the existing machinery of private enterprise do the work in practically the same way as it was formerly done by the public. Thus the public would lend their money direct to the borrowers, which would be better and cheaper than if it were collected and disbursed by local authorities or other representatives of the public. The mortgage limit to be higher than the usual two-thirds and the interest limit to be higher than War Loan interest. The Government to guarantee the mortgage interest for a period of years upon approved and independent valuers' reports obtained by mortgagees in the usual way. A small fee in each case to be paid to the Government by the mortgagee for the guarantee; this would assist to pay the Government's administrative costs. If the interest payable by the owner to the mortgagee be in arrear for, say, six months, the Government to have the right to require foreclosure and a public sale of the property by the mortgagee, the Government retaining a lien on the proceeds, and then settle with the owner and mortgagee. The Government would probably be called upon to pay but little interest, and when paid it would soon be recouped by the sale, and there should be no bad debt. Flats are greatly needed in towns, and single flats could and should be sold as well as let to occupiers.

"(5) With forty-four years' experience of building work, I venture to think that the cost of arranging such Government aid, decentralised by the assistance of local authorities, would be comparatively small. The scheme might prove to be self-supporting.

"(6) It is now quite possible to build good and suitable houses and flats with existing materials without the aid of either bricklaying or plastering, the two depleted trades which are largely retarding building.

"(7) Unskilled and women workers can be largely employed in building brickless houses, and this should be permitted untrammelled by unnecessary by-laws and trade union rules.

"(8) Such a scheme would probably and speedily attract millions of pounds of private capital for housing, much of it now lying idle, a large amount being deposited in banks. The money thus used would, however, not vanish but merely circulate and oil the wheels of industry. A great and immediate development of competitive building by private enterprise would, I think, be inevitable, and rents would consequently soon decrease. Adequate supply for the demand is the best and surest way to reduce cost and rents.

"(9) All the capital thus invested by the public on mortgage of this real estate would possess the country's new guaranteed security. I think this inducement would produce from the usual business sources all the necessary money, the builders, labour, materials, and the dwellings, too, at reasonable rents. The security of real estate in this country stood the strain of the Great War as well as, if not better than, any other.

"(10) It is unlikely that the gradual diversion of so large an amount of liquid capital for developing real estate throughout the country would have any depreciating effect upon gilt-edged securities, while it would produce probably millions of additional small property owners, thereby developing thrift and contentment in the country.

"(11) Capital thus invested would necessarily percolate into numerous other channels and undoubtedly stimulate trade in various other directions, while, at the same time, it would provide additional employment for all those contributing work in any trade connected with housing and the equipment of the buildings.

"(12) If this scheme be deemed worthy of a trial, it could do no harm and would not be costly, but it should be thoroughly advertised in the public Press, and during the trial the Chamberlain Act might be extended."

CORRESPONDENCE

The New Session.

Sir,—The leading article on "The New Session," published in a recent issue of *The Builder*, represents, I think, what has, for some time, been the undercurrent of opinion in many quarters, and should prove of value as a starting point in what might be a very instructive exchange of ideas on the subject.

It is now evident that public interest in good architecture is growing, and the moment therefore seems opportune for the Institute to give a lead on such questions as the national housing problem as is suggested in your columns.

It would, no doubt, be of considerable assistance to the R.I.B.A. Council to have the opinion of members of that body and others interested in the matter on the various points to which you call attention, as it is evident that no useful action could be taken in the matter unless it was supported by the profession as a whole. The obvious way for this to be ascertained would appear to be for readers to express their views in your columns.

P. Cart de Lafontaine.

Ministry of Labour.

We have received a letter from the Ministry of Labour in which they state that over 79,000 ex-officers and educated ex-service men have been assisted by the Appointments Department of the Ministry of Labour to find appointments. The number remaining on the Register is 2,300, and on their behalf they make an appeal to our readers. The aim of the Committee is to find suitable work for these men immediately, and they believe that a renewed effort on the part of employers and the public generally would result in a solution of the problem. The Register covers men of every qualification. Vacancies should be sent to the National Appointments Committee, 3–4, Clement's Inn, Strand, W.C.2. (Telephone, Regent 5220.)

Trafalgar-square Improvements.

The Finance Committee of Westminster City Council, at a recent council meeting, submitted an estimate of £35,000 for the purpose of constructing underground footways from north to south at Trafalgar-square. The main subway will begin with a flight of steps at the corner of The Mall Approach, connect with the Tube stations, and emerge at existing exits from the latter in Trafalgar-square and the Strand. A widening of the carriage road is provided for by the scheme. The Council recommend that the work be authorised and that detailed estimates be prepared.

SOME NOTES ON THE DESIGN OF CINEMAS

ER may be said of the general level oduction, there will be few who will hat many cinema buildings maintain gh standard of architectural merit at has been rapidly progressive during ars. The architect who designs nds himself, therefore, in a very us position, in that he is at least th modern thought, if not, as many far ahead of it.

ect of cinema design is one of peculiar the profession, and it presents a portunity of expressing an essentially novement, unfettered by that pro- norance that is unprepared for events. admirable articles have been written subject, and in these notes we shall stress the bare essentials and present act form those points of the subject otherwise too much buried in matter ly extracted.

Choice of Site.

it is not already pre-imposed, this have a very important bearing upon of the scheme. A site chosen near ntre, or at the close of a street vista, o streets on three sides and one at en an important thoroughfare, is to rt to the scheme that will carry it a owards success before pencil touches is extraordinary how lazy is the eking crowd and how reluctant to e beaten track in its quest after the nted place of amusement. Another eature in the selected site is that it pe towards the convenient position reen, and so obviate the necessity of avation.

Planning.

selected a suitable site, there will problem of splitting it up in the most ous manner. The ideal shape for the n will be that of a wedge or fan, that be no section of the seating from s not possible to obtain a reasonably ew of the screen. Important as this an ordinary theatre, it is doubly so e of a cinema, for where in the one unfortunate members of the audience part of the scene cut off and miss near the wing, in the other case is entirely distorted, in the worst unting to the indecipherable. Such no legitimate money value. Where gle is imposed by natural conditions ape of the auditorium, the seats ap- the screen must be limited by the m and the remaining floor space in s by the screen usefully occupied as ooms for artistes, exit lobbies, organ ome other such purpose. In conjunc- the auditorium have to be arranged le, the staircases to balconies (if any), ccommodation, administrative offices, box and re-winding room, and the and we will consider these units in an eye chiefly to plan.

The Vestibule.

uld be treated in a striking architec- ner, but without vulgar display. that the vestibule is visible from d must invite the public, and is also npression which the visitor gets of on entering. The gaudy, vulgar is no longer regarded as sufficient for the public, and it is left for the find a better way, so that the public with regularity to the popular place ment for its own sake as well as for of the entertainment, which is under ol.

Staircases and Exits.

e case of the theatre, the cheaper seats e not in the gallery, but are generally, ate, sometimes, just within the limit of comfortable focus, and the gallery becomes the home of the elect, where their view approximates most nearly to the normal throw of the picture. The balcony staircase should generally be planned in conjunction with the vestibule and opening therefrom with some architectural importance.

The arrangements of exits and staircases is largely governed by regulation, though the mushroom growth of the industry has not permitted that uniformity of law throughout the country that must ultimately and inevitably arrive. The Cinematograph Act of 1919 is by no means all-embracing, and details are filled in by local authorities, in the form of by-laws, county council regulations, police regulations, or even in some cases by the ruling of that ubiquitous body the Watch Committee.

Generally the following rules will meet most conditions and it is certainly wise to aim at them as a sensible minimum of safety. Two separate exits per floor for each 500 persons should be provided, and one additional for every further 250 per floor, and each exit should be 5 ft. wide in the clear between doors when open. All exit doors must open out and any other doors opening on to an exit corridor must be hinged on the side that will ensure that they will be driven closed by a stream of people leaving the hall in a panic.

Mention has been made of the desirability of choosing a site that is open on three sides to the public street. Where in default of this advantage any exits cannot discharge direct to the street, a 10 ft. wide way must be provided for this purpose, and this may well cut off a very material area from the site.

Staircases should be 5 ft. wide at their narrowest point (or 4 ft. where the accommodation is under 300). Even where regulations do not demand it, it is well to arrange the staircase of even "bore" throughout with all external angles rounded and all internal angles the arcs of circles. This will make the quarter space landing a quadrant, and the half space a semicircle and so obviate the trapping of people in a corner during a panic rush. Steps must not be less than 10 in. on tread or more than 6 in. in rise, with a maximum of 15 risers to a flight and not more than two such flights without a turn. An emergency external iron staircase from the balcony is also required. All exits should, of course, be provided with panic bolts. Where exits open direct on to a street without intervening corridor, a width of 4 ft. 6 in. is allowed in some districts instead of 5 ft. Exit doors must be provided on three sides of the auditorium, one wall only being permitted as a blind side, and this is generally the screen end. Occasional steps are not allowed in corridors, not less than 3 at a time passing under this rule.

Waiting or "queue" corridors seem to be passing out of favour, but quite a considerable queue can be accommodated in a small space by a judicious arrangement of rails leading ultimately to the pay-box. As a general rule, however, the average cinema with a continuous programme can cope with its patrons without resorting to the queue.

Lavatory Accommodation.

It is desirable to arrange the lavatory accommodation for both sexes on each floor in a position at once accessible but unobtrusive, and in addition there must be similar accommodation for the use of the staff. In the smaller class of theatre it is best to arrange the w.c.'s with penny-in-the-slot locks to limit their use and obviate the need of an attendant. In the better and larger theatres it can be taken for granted that there will be an attendant and the lavatories can be planned on more spacious lines and perhaps in conjunction with cloak-rooms.

Where the main body of the hall caters for two distinct classes of patron, it is well also to separate the ground floor lavatory accommodation and the balcony lavatory accommodation; a very good arrangement is to place the first-class lavatories off a mezzanine landing to serve the balcony and the rear ground floor.

Administrative Offices.

These should include a manager's room, with clerk's office attached, switch-room, heating chamber, generator room, store rooms, staff rooms, &c. It is advisable to arrange the main box office *en suite* with the administrative rooms. The manager should be placed in such a position that supervision over all branches of the establishment can be readily maintained. Different managers have their own ideas upon the subject, and where possible it is wise to obtain the views of the one who is to be appointed in the case in question, that there may be no future cause for complaint. A manager who is dissatisfied with

From "The American Architect."

Entrance Lobby, Easton Theatre and School of Music, Rochester, New York.
MESSRS. GORDON & KOELBER, Architects; MESSRS. McKIM, MEAD & WHITE, Associate Architects.

the arrangements of his own particular department can make things very unpleasant and injure the reputation of the architect, if he is that way inclined, and in any case we should aim at the particular ideal.

The Operators' Room, &c.

This is a very important part of the establishment, and is more often than not far too cramped for easy working. It should, of course, be of fire-resisting construction throughout, well ventilated, and near and accessible to the generator room. There should be two means of escape, preferably one leading out over the roof, and the other leading down and out so that outbreaks of fire from different quarters can be avoided. The door must be self-closing, and of teak or other suitable hard wood, as must all other joinery in this part of the theatre. A space of 12 ft. by 8 ft. is a desirable minimum for this room, and even more space is not extravagant. There should be at least two apertures for projectors, and in larger theatres three or more with corresponding observation holes, and all with self-acting shutters on the operators' side, in case of fire. It is also well to have clear plate glass in all apertures to deaden the sound of the machines. The walls and fixtures and ceiling of this room should be finished dull black. Good ventilation to the open air is very necessary as this room gets very hot and stuffy and unhealthy to work in. The re-winding room should be separate but *en suite* with the operators' room, and all woodwork therein also in teak.

Orchestra, Stage and Screen.

It is most necessary that the orchestra lights should be carefully shaded as not to cast any light upwards on to the screen or in front of same. At the same time the entirely hidden orchestra is a little foreign to this country. A small stage, 4 ft. to 6 ft. wide, and about 4 ft. 6 in. above the floor, is a wise provision if not an absolute necessity, as it allows the hall to be let off for Sunday meetings and concerts, besides providing a stand for lecturers upon certain films and for variety turns. In connection with the stage should be arranged rooms and lavatories for artistes, utilising the space behind the screen or the corners of the auditorium where it has been indicated that seats cannot be placed.

The screen is obviously of great importance, and its position should be as near as possible normal to the centre ray of the picture, though this is rarely achieved except where the operators' box is set in the front of the balcony, or from behind the screen, which does not appear to find much favour, in spite of many obvious advantages. The screen itself being tilted about 7 to 9 deg. pitch must, for reasons of economy, be constructed on a stud framework to save the cost of a battered main wall. The actual size of the screen will vary according to the size of the theatre, and the throw of the picture, but in any case it should be proportioned as 3 is to 4. Probably the best material is lath and lime plaster, a finish that absorbs condensation which otherwise would tend to collect and run down the screen in a disfiguring manner. There are also patent mixtures on the market, and also specially treated canvas. The surround of the picture should be masked with black material to cut off the irregular outline of the projection, and for effect it is usual to treat the screen feature in the form of a proscenium arch framed in with a bold architrave mould often heavily enriched. A dark curtain to cover and disclose the screen as the pictures change and thus never leave the plain white screen exposed is another smart arrangement. The curtain can be drawn by an electric motor operated from the operators' box.

Seating.

Passing from these separate units of the theatre, we have the all-important question of seating, which is dependent upon the section of the theatre. It cannot be too strongly urged that for every separate theatre scheme empirical rules should not be too much relied upon, and the only royal road to the ideal arrangement is by way of a careful section set up for each case. Points to be specially watched are (1) that the ray from the projector to the bottom of the picture is above the heads of the patrons entering by the balcony gangways. There is nothing more irritating than to have bobbing shadows constantly interrupting the picture. (2) The slope of the floors and balcony should be arranged so that each eye level should clear the heads of those sitting in front, towards the bottom of the picture. (3) That the ray from the eye level of those standing at the back of the ground floor should clear the bottom of the balcony towards the top of the picture. Standing eye level may be taken as 5 ft. 6 in. above floor, and sitting as 4 ft. These points present simple problems in the case of a rectangular hall with straight rows of seats and balconies, but where in the more usual cases the rows and balconies are curved, a number of oblique sections should be tried up to ensure the perfect arrangement. (4) The bottom of the picture should not be more than 7 ft. 6 in. from the floor unless the front portion of the floor is tilted up towards the screen about 1 in 15, and the seats on the same arranged with level legs and so tilted back to relieve neck strain. (5) The front row should not be less than 18 ft. from the picture. (6) The rows should be 2 ft. 4 in. back to back for the ordinary seats, and 2 ft. 9 in. for the better class seats, and from this it will be possible to set out the ideal line of floor by drawing rays from the bottom of the picture to the head level of each row, and producing to the next row behind, giving the eye level thereof. This ideal floor line will be found to be a curve, but this must be separated up into slopes, generally a slope down from the screen with a flat between that and the slope up towards the back of the hall. These slopes must respond to the worst case in each section. In width the seats will vary from 19 in. centres for the ordinary seats up to a maximum of comfort of 22 in. centres for the best seats.

In planning gangways it is necessary to give a clear width of 5 ft. to the main ones leading direct to the exits; and other gangways, at least 3 ft. 6 in. between seats. No seat may be more than the seventh from a [illegible] or, in other words, where the row of s[eats] upon a wall there may not be more t[han] seats in that row, and where they run [be]tween gangways there may not be more tha[n] seats in a row. Reverting once mo[re] section of the theatre, it will be found [the] line necessary to ensure a clear view of [the] picture from all seats in the balcony, w[ith] tate a slope to the latter that will be [not] to be dealt with simply as an inclin[ed] and it will be necessary to raise th[e] tiers, generally about 12 in. high, w[ith] mediate steps of not more than 6 in. [in] balcony gangways.

Ventilating and Heating.

The Plenum system of ventilation i[s] able ideal, but seldom permissible on t[he] of cost. Electric fans should be arran[ged] there is no fear of draught beating do[wn] audience, and it is well to provide [the] fans that can be operated between per[for]to rapidly clear the air of smoke and i[ts] Low pressure hot water heating is the [most] accepted system, and here again [the] should be arranged with discretion so [as] inconvenience individual members [of] audience. Where baffle plates are pr[o]the radiators, these should be remo[ved] the backs of these fittings are favour[able] tacles for cigarette ends and chocolate [pa] A portion of the auditorium that s[eldom] receives neglect on the score of vent[ila]the ground floor under the balcony, w[hich] particularly liable to become foul, ow[ing] upward slope of the balcony ceiling [to] a trap for foul air. A sliding roof i[s] ideal comfort that cost as a rule ve[ry]

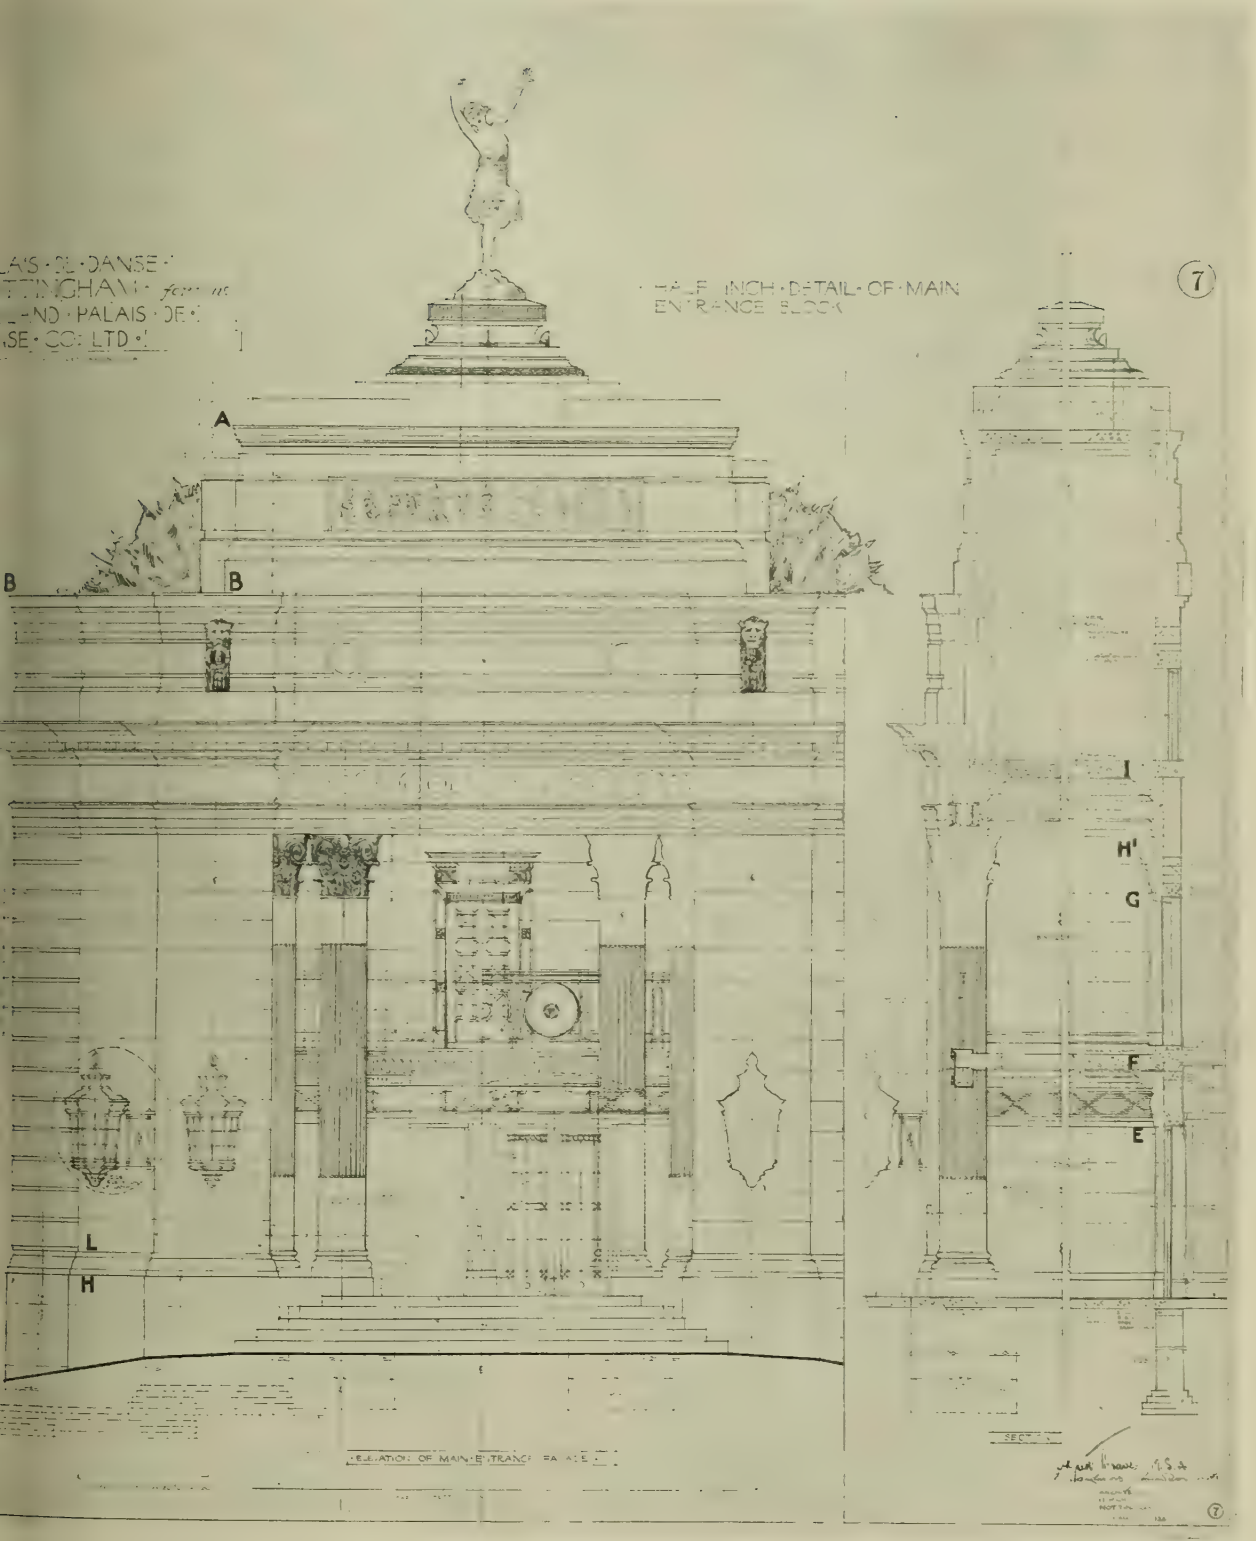
Lighting.

Electric light is almost universa[l] even where there is no public supply [of] it is usual for the cinema to run its own [gas] ing plant, from which light and power [for] projectors, winding machines, curtain [gear] &c., is obtained. All lights should be [fitted] with a dimming apparatus, by which t[he] glare of the lights after a period of semi[-]is avoided. All the lights of the a[uditorium] should be under the control of the [operator] to ensure co-ordination. In additio[n] electric light, gas lighting must also be [fitted] as a safeguard against the failure o[f the] rent. Exits must be lighted with ga[s] taps, and in boxes covered with red gla[ss] the word "Exit" in white letters.

Authorities differ as to the advis[ability] providing windows. The claim that [they] means a considerable saving in curre[nt] cleaning operations is a little extrava[gant] much can be done with all doors op[en] few lights on to supplement the di[ffused] obtained. It is rarely that windows, [if] vided, can be efficiently masked d[uring] formance.

Tea Rooms.

General experience seems to indica[te] rooms in conjunction with a cinema [are] themselves paying propositions, bu[t] little doubt that they are sources of [profit] towards the establishment, and give [the] complete luxury and convenience to [the] that can hardly fail to attract a pub[lic] must be many shillings spent in t[he] that should rightly be credited to the [cinema] and they continue to appear in new s[hapes]



The whole question of cinema c[an] matter of £ s. d. and of a wise balan[ce] outlay and anticipated revenue. Th[e] has undoubtedly entered into the s[tage] problem without priggishness or [false] academism, and with a result that [is] a young industry a long way toward[s] Would that we might be able to [say] readily with many other of the [arts] building as they exist to-day.

GAS-FIRED BOILERS INSTALLED FOR HEATING PLENUM SYSTE AT LONDON CINEMAS

In an article entitled "Gaseous Fuel as an Aid to Smoke Abatement," which appeared in our Heating and Ventilating Number, of September 30, 1921, we first drew attention to the possibilities attached to gaseous fuel for central heating systems, and mentioned that in this field the use of gas was beginning to extend. In September, 1922, in an article entitled "The Progress of Gas Heating," attention was again drawn to this subject, and details were given of the application of a gas-fired steam boiler to a central heating and ventilating system in a synagogue in the West End of London.

It is interesting to note that the possibilities to which we drew attention in these articles have recently been more fully recognised, gas having been adopted as the heating agent for several central heating installations of considerable magnitude. Our readers will, no doubt, welcome a description of one of these which includes several novel features.

Heating Plant at the Tolmers Cinema.

A gas-fired boiler was installed during last winter at the Tolmers Cinema, Tolmers-square, Hampstead-road (seating 1,250 people), where it is used in connection with an up-to-date "Plenum" heating and ventilating system. A plan of the Plenum chamber is shown in Fig. 1, and the following is a brief description of the plant, which was installed by the Wembley Heating Company, Ltd. It embodies all the latest mechanical devices, and in every way complies with the requirements of the London County Council, whose inspectors have examined and approved the installation since it was completed, and when in use.

Air, after being drawn in from the outside by the action of an intake fan, passes over a number of atomisers, which eject water in the form of mist in order thoroughly to saturate and wash the air. It is then passed over a number of specially constructed dirt eliminator plates having many deflections, which, owing to their construction and the velocity with which the air passes over them, pick up and retain the whole of the dirt contained therein. Jets of water are continuously playing on the plates to cleanse them, and the whole of the dirt is thus carried into a sump at the bottom of the washer. Some idea of the efficiency of this operation may be gathered when it is noted that it is necessary to clean out the sump every morning before the plant is started. After passing over the cleansing plates, the air is partially dried and raised to the required temperature by passing it through a tubular steam heater. This heater is constructed of 1-in. tubes supported vertically, and supplied with steam from a gas-fired boiler. This boiler is of the tubular pattern, but instead of ending in a fire box, the tubes are extended to the front plates (see photograph in Fig. 2). These tubes have spirals fitted within them in order that the maximum amount of heat may be extracted from the gas flames which play into them, and from the products of combustion during their passage through the tubes to the flue outlet at the other end of the boiler. As a proof that this desideratum is reached, it may be mentioned that after the gas has been burning for some hours it is quite possible to place a hand at the flue outlet without experiencing discomfort.

The steam heater was designed to dry (partially) and warm the necessary quantity of air, while working at a steam pressure of 4 to 5 lb. per sq. in., and the gas boiler is, therefore, adjusted to maintain this working pressure, which is reached within 30 minutes after the gas has been lighted. The boiler is controlled by a thermostat which automatically reduces the gas consumption whenever the steam pressure rises above a pre-determined figure, *i.e.*, slightly higher than that needed for the steam heater. A further automatic control, which is electrically operated from the auditorium, has been installed—a full description of which is set out later in this article. The condensed water from the steam heater is returned to the gas boiler by gravity, without the aid of any mechanical device, and apart from lighting the gas and starting the motors for driving the fans an hour or so before the cinema opens, no attention whatever is required to the apparatus. The simplicity and efficient running of the plant are thus clearly indicated. After the air passes through the steam heater, it is propelled to the auditorium through underground ducts by means of a centrifugal fan, which runs at a very low speed in order that there shall be no noise to disturb the audience. The air, heated to a temperature of about 68° Fahr., then passes over gratings into the auditorium. A low velocity is maintained to prevent draughts, which are such an unpleasant feature in some public buildings. The vitiated air is extracted through ornamental gratings in the ceiling;

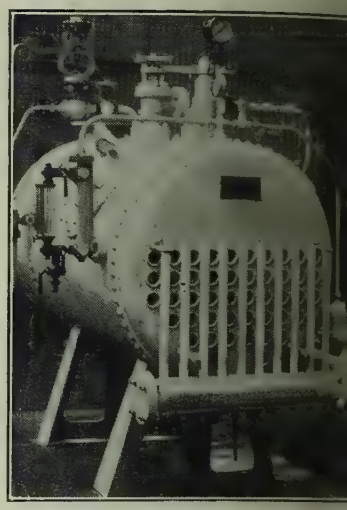

Fig. 2.

then carried along trunking in the roof and subsequently discharged into the sphere by another centrifugal fan.

The motors of the intake and extract are interlocked, and are both controlled the Plenum chamber, by which means t tract fan cannot be put in motion unle intake fan, providing pure air, is running maximum heating capacity of the pla 1,086,000 cu. ft. of air, and the gas bo which is only 3 ft. in diameter by 5 ft. long—is capable of providing a maxi duty of 800,000 British thermal unit hour, with a consumption of about 1,900 ft. of gas=9½ therms per hour. As th mand, however, is approximately 70 British thermal units per hour, the maxi gas consumption is about 1,650 cubic ft therms, which is only consumed when plant is being heated from cold, or tempo after having been shut down by thermo or thermometric action.

The Thermostatic Control.

When the system has become fully h and the steam pressure at any time ris the predetermined figure (about 6 lb.), thermostatic control on the boiler comes action and the gas is entirely shut off, e for a by-pass supply, by which the gas fl are left burning low in the tubes at a

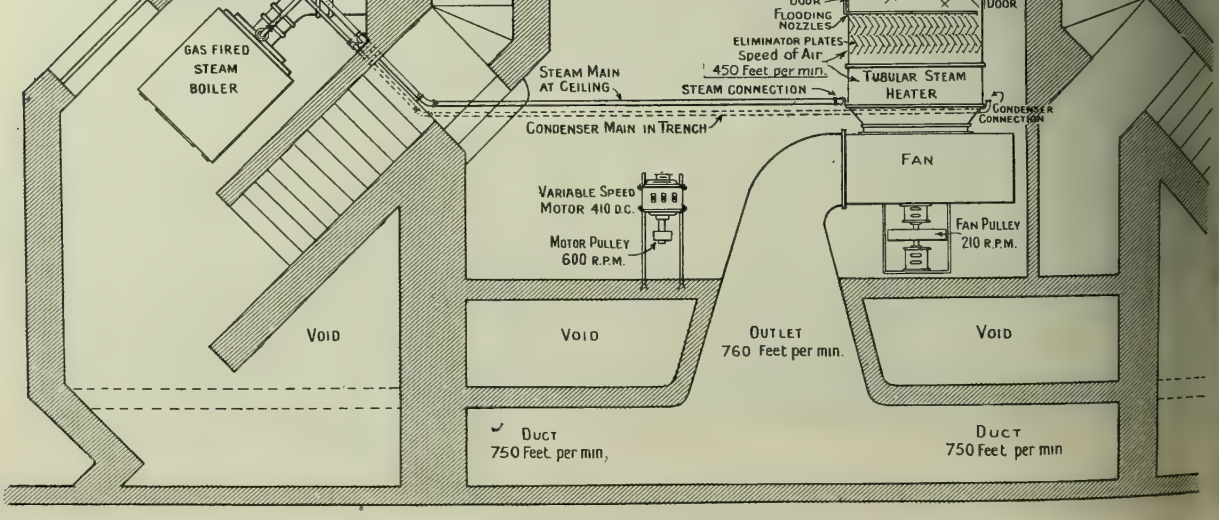

Fig. 1.—Plan of Plenum Chamber.

ion of about 300 cubic ft. per hour= rns. Directly the steam pressure drops to the cooling effect of the air passing h the heater, the reverse action takes the thermostatic valve again opens and nsumption increases to the maximum This action, *i.e.*, the alternate shut- ff and opening up of the thermostat, is uous during the whole time air is being , thus materially reducing the consump- f gas.

ther Control by Electrically Operated Valve.

ost interesting—and, as an aid to the ed use of gas as a fuel in cinemas, a aluable—feature of the installation is the idge automatic temperature control ap- s, which is fixed in the centre of the front gallery, and may be seen in the photo- Fig. 3). This instrument acts as a further , and automatically reduces the amount consumed, because, when the tempera- the cinema reaches a predetermined the boiler is shut off except for a by- It will be seen, therefore, that there o controls, one actuated by the steam e when it reaches a certain figure, e other by the temperature of the air auditorium, and economy in the con- n of gas is thereby doubly assured. oviding an opportunity of enjoying all antages attached to such a labour- and convenient heating agent as gas, mparatively low fuel cost. It may be ed that when gas boilers are installed t necessary to set aside—or take up— e space for the storage of fuel. No incurred for labour, and no storage or of ashes is involved.

ction of the Cambridge automatic tem- e control apparatus is as follows:—A indicating thermometer is fitted in a approximating to the centre of the um—a convenient spot in this case ne centre of the front of the gallery, in photograph (Fig. 3). The instru- as two hands, one a short pointer, nay be set at any desired temperature s case it will be seen to be about . Fahr.) and the other an ordinary " arrow " registering pointer which ted in the ordinary thermometrical by a rise or fall in the temperature all. Mercury is contained in a special lb, which—it will be noticed in the ph—projects through the instrument uspended below the dial. As the mer- pands it actuates a bourdon spiral,

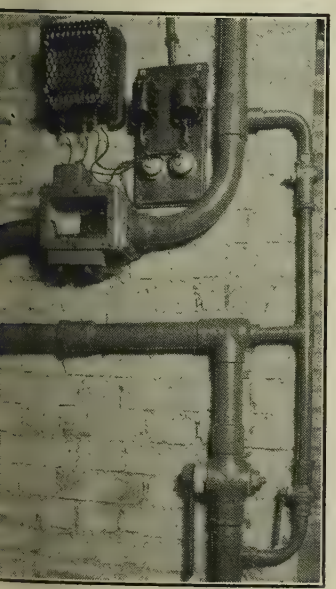

Fig. 4.

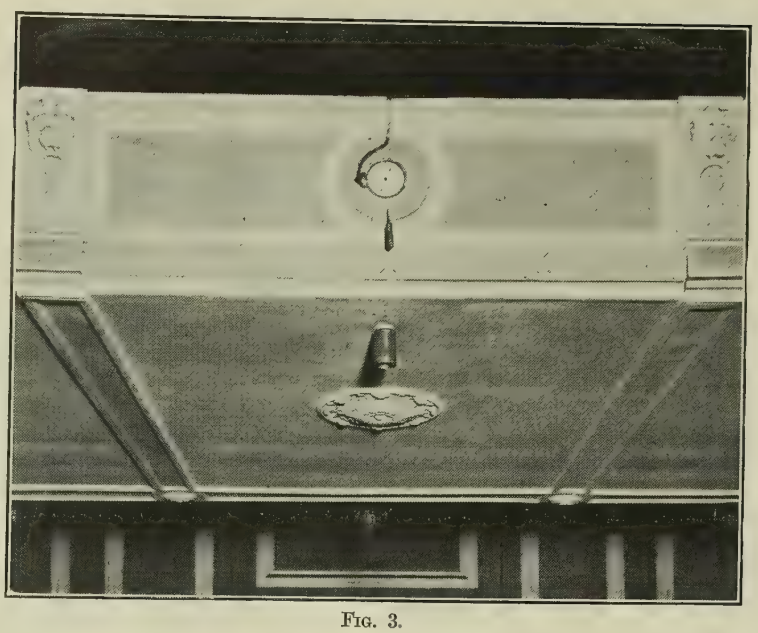

Fig. 3.

thus causing the registering pointer to indicate the temperature on the dial. A pair of electric wires are run from the instrument to a valve in the basement (described later) and these wires are so connected to the instrument, that the circuit is not complete, until the registering pointer rises to the predetermined temperature, when it makes electric contact by touching the short pointer " set " at this figure. The valve action in the basement near the gas boiler is contained in a hermetically sealed box, fitted with a plate glass front, in order that the mechanism may be seen to be working, and thus known to be in order. This valve box is interposed at a suitable position in the run of the gas supply pipe to the boiler, as will be seen in Fig. 4, and a by-pass is run from a position above the valve box, again entering the supply pipe below it, thus ensuring that a certain amount of gas will always flow past to the boiler (to maintain the heat therein) even though the automatic valve is shut off. A front sectional elevation of the valve box and the mechanism it contains may be seen in Fig. 5. The action is as follows:—

The glass-fronted box contains a double-beat valve A, through which gas passes to the boiler as indicated by the arrows shown in the drawing. This valve is attached to a lever B, which is pivoted at C, and the other end of the lever is held down by a spring D beneath an electric coil E. The current to this coil will be noticed, in Fig. 4, to be passing from the main cables through resistance, but the voltage and current necessary is so negligible (about 4 volts) that the apparatus could readily be worked from accumulators if required. If and when the temperature of the hall as registered on the thermometer shown in Fig. 3 reaches the desired figure (*i.e.*, the degree at which the short pointer has been set) electric contact is made at the instrument, and the current then passes around the coil in the valve box in the basement. This sets up a magnetic field in the coil, which pulls up a solenoid attached to the spring D, thus raising the lever, which action entirely closes the valve A. The gas supply to the boiler will then be shut off with the exception of that flowing through the bye-pass previously mentioned, which quantity has also been predetermined by the cock shown at the top of the bye-pass supply (in Fig. 4) being set at a point which will allow about 300 cu. ft. per hour to pass. If and when the temperature of the hall drops below the desired figure, electric current is again broken at the instrument in the auditorium, the spring D is thereby released from the magnetic influence and again pulls down the lever B, thus reopening the valve and allowing the full gas supply again to pass to the boiler.

From the foregoing details, it will be gathered that the whole installation is so regulated and controlled that the greatest possible degree of economy in consumption of gas is assured, while the plant also rapidly responds to changes in temperature, thus ensuring the utmost degree of comfort, adaptability, convenience, and saving of labour.

Another Installation.

It is worthy of note that an even larger Plenum system than the one set out above, also heated by gas-fired boilers, has recently been completed at a new and very fine Cinema (known as the " Capitol ") in Haymarket, London, on a site adjoining Piccadilly Tube Station. This installation, again, presents several novel features and, owing to the great value of ground area—and, therefore, floor space—in this neighbourhood, the boilers are installed in the roof. They supply hot water to a Plenum system operating many feet below their level, and circulation is effected by means of an impeller. In this case two gas-fired boilers of the Spencer Bonecourt type are installed, capable of providing over 1,500,000 B.Th.U.s per hour.

It will readily be realised that solid fuel, with the difficulties attendant upon its delivery to the top of the building and the daily removal of ashes and clinker, could not have been used under such circumstances, and that the adoption of gaseous fuel also obviated the necessity for the occupation of costly room for fuel storage.

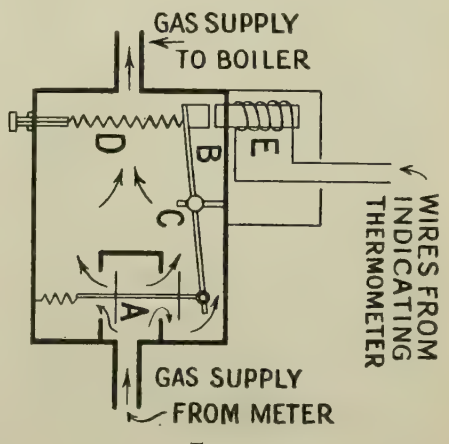

Fig. 5.

ILLUSTRATIONS

The Shepherd's Bush Pavilion.

Mr. Frank T. Verity, F.R.I.B.A., is the architect of the Shepherd's Bush Pavilion, and was last week awarded the Royal Institute of British Architects' Medal for the Best Street Frontage built during the year, for this building. The following were the contractors and sub-contractors:—F. Bradford & Co., reinforced concrete steppings to pier; Clark & Fenn, all plaster work, including decorated fibrous-plaster work; G. C. Cuthbert, copperlite glazing; W. H. Collier & Co., special bricks and arch tiles; J. Compton, Ltd., organ; C. W. Courtenay & Co., stonework; Archibald D. Dawnay & Son, steelwork; Express Lift Co., lifts; J. W. Gray & Son, lightning conductor; Haywards, Ltd., casements; Helliwell & Co., casements; J. A. King & Co., pavement lights; London Asphalte Co., asphalt; Malcolm MacLeod & Co., Ltd., concrete steps throughout building; M. & R. Moore, marble work; F. H. Pride, electric light fittings and bronze standards; Geo. Pixton & Co., theatre chairs; Reading Boiler Setting Co., boiler setting; Sinclair & Co., fire hydrants; Stephens & Carter, flagstaffs; Sturtevant Engineering Co., vacuum cleaning installation; Synchronome Co., Ltd., electric clocks; Waring & Gillow, painting, decoration, carpets, and curtain; Young, Austen & Young, heating and ventilation; Robert Young's Construction Co., joinery; Mr. Basil Davis was responsible for the design of the electrical installation.

The ornamental grille and electric torches on each side of the main auditorium were executed by Light Steelwork, Ltd., 178, York-road, King's Cross. The same firm were also responsible for the front entrance door grilles, the upper rails, iron stairs, and lights in this building.

The complete fire protection has been undertaken by Messrs. Sinclair & Co., of 8-9, Clerkenwell Green, London, E.C.1.

Kensington Cinema.

The seating accommodation of this cinema is 2,370; with allowance for standing the total is 3,200. The estimated cost is £150,000. The general contractors are Messrs. Joseph Mears, Ltd., and although all the sub-contracts are not let, the following have been allocated:—Steelwork, Messrs. Morland, Hayne, Ltd.; granite work, Mr. W T. Goodale, Twickenham; artificial stone, Messrs. The Impervious Stone Co.; casement and cast-iron facias, Messrs. The Luxfer Prism Syndicate, Ltd.; faience work (terra-cotta), Messrs. Shaw's Glazed Brick Co.; architectural modelling to exterior, Messrs. John Daymond & Co.

The architects are Messrs. Granger & Leathart; quantity surveyors, Messrs. Booth E. Dickie.

Palais de Danse, Nottingham.

The main entrance is at the point of a triangle, and this has been made the most important feature of the external treatment, of which all elevations are executed in Weldon stone. Over the entrance lounge the roof is formed with a concrete flat covered with "Ragusa" asphalte, it being the intention to form a roof garden or open-air café for summer use. The entrance vestibule is executed in stone, and leads into the foyer. On each side of the foyer doors lead into cloakrooms, &c. The main entrance to the salon dansant leads direct from the foyer, which passes into a promenade surrounding the whole of the dance floor. This will be used for the service of light refreshments whilst dancing is in progress. There are four main staircases leading from the promenade to a balcony promenade, which entirely surrounds and overlooks the salon dansant. This also is designed for the service of refreshments. There is a series of electric lifts connecting the balcony promenade, dance floor, and supper rooms under.

The walls of the dance floor, balcony, smoke lounge, and supper rooms are decorated with Columbian pine panelling treated with the "Drytone" process. The main ceiling is cambered and divided into panels, which have grilled openings in them and extract fans over. The whole of the fibrous work in the salon dansant is designed in the Georgian style. The dance floor is of the latest type "Valtor" spring floor. A feature is made of the tympanums at both ends of the salon. These will contain frescoes depicting the spirit of dance and carnival.

The general contractors are Messrs. W. & J. Simons, of Nottingham, and the sub-contractors are:—Steelwork, Messrs. W. Richards & Sons, of Leicester; heating, Messrs. Goodacre, Glover, & Butler, of Nottingham; ventilating, Messrs. Goodacre, Glover & Butler; fibrous work, Messrs. W. J. Wilson & Son, of Mansfield; external stone work, Messrs. The Croft Granite Co.; asphalte roofs and flats, The Ragusa Asphalte Co.; sanitary goods, Mr. F. Binley, of Nottingham; spring floor, The Valtor Spring Floor Co., Ltd.; ornamental ironwork, electrical work, &c., by various contractors.

Messrs. Thraves & Dawson are the architects.

"Majestic" Picture Theatre, Leeds.

This theatre has separate entrances from Wellington-street and Quebec-street, Leeds, into entrance halls with staircases to balcony level and the rotunda and parterre level. The rotunda has two galleries, giving access to the balcony. The two foyers are 34 ft. by 24 ft. The auditorium provides accommodation on the parterre level for 1,400 persons; and the balcony accommodates 1,200. There are two exits from the balcony and four from the parterre. A platform has been arranged in front of the screen. The heating and ventilation are a combined system, whereby filtered and humidified air is forced into the building, heated in winter and cooled to 15 deg. below outside temperature in summer; the whole of the air in the building is changed four times every hour.

Messrs. P. J. Stienlet & J. C. Maxwell, of Newcastle-on-Tyne, are the architects. General building and reinforced concrete work, W. T. Weir, Howdon-on-Tyne; terra cotta, granite, sanitary fittings, Leeds Fireclay Co.; steelwork to roof, H. T. Newbigin, Ltd.; plumbing, tiling, mosaic, J. Rowell & Son; heating and ventilation, Cleworth Wheal & Co.; kitchen fittings, &c., R. Crittall & Co.; asphalt work to walls, concrete floors and roofs, Limmer Asphalt Co.; seating, J. Edgerley; rubber flooring, Victory Rubber Co.; parquet flooring, Turpins' Parquet Flooring Co.; granite columns, Emley & Sons; canopies, casement gates, &c., Haywards, Ltd.; staircase casements, Crittall Manufacturing Co.; pavement lights, fibrous slab, &c., J. A. King & Co.; vacuum cleaning, British Vacuum Cleaner Co.

"Central" Cinema, Bury St. Edmunds.

This cinema is in course of erection for the Central Cinema Co., Ltd. The windows in the auditorium will be made to open for ventilation and sunlight when the theatre is closed, and also for light when cleaning; roller shutters will be arranged outside each window and the glass will be illuminated by electric lights behind, the glass being deep blue cathedral glass from Messrs. Pilkington.

The contractor is Mr. F. R. Hipperson, Norwich and London, and the sub-contractors are: Steelwork, Messrs. Boulton & Paul, Norwich; heating, lighting and ventilating, Messrs. Allen & Son, Cambridge; plasterwork, Mr. R. Green, King's Lynn; metal windows, Messrs. Crittall, Braintree; asphalte roofing, Messrs. The London Asphalte Co.; asbestos tiling, Messrs. The British Fibrocement Works, Ltd.; sanitary fittings, Messrs. J. Bolding & Sons, London; marble steps, Messrs. Anselm, Odling & Co., Ltd., London; furnishings, Messrs. Beck & Windibank, Ltd., Birmingham.

Mr. A. T. Latham, 21, Bedford-row, London, is the quantity surveyor, and the architect is Mr. L. E. Cole, A.R.I.B.A., Newmarket.

The "Savoy" Cinema, Hull.

The "Savoy" Cinema, Hull, has been under the promotion of Messrs. The (Hull), Ltd. The erection of the b was commenced in October, 1922, and opened on October 29, 1923. The whole has been executed from the designs of Blackmore, Sykes & Co., architects, of chambers, Scale-lane, Hull, under whose vision the work has been carried out.

The site is a rectangular one, with fr to Morrill-street and Holderness-road, a whole area is occupied by the theatre subordinate rooms. In addition to the the scheme embodies two shops and a hall with twelve tables. The building signed in the Neo-Greek style, and the tions have been executed in narrow san bricks, white pointed, and with stone dre

The entrance has been made the feature of the front elevation, and imme over the entrance is a large central ste dow, extending through two stories. central elevation is 55 ft. high, above is surmounted the central lighting st extending a further 14 ft. in height, and is completed with an electric light of candle power. The entrance opens i entrance foyer, 30 ft. by 30 ft., architec treated in fibrous plaster and with p oak-block flooring. From the foyer two entrances to the auditorium and t staircases leading to the crush hall balcony. Ladies' and gentlemen's lav are located on respective sides of the and are approached by concealed ent The operator's box, re-winding roo attendants' room are situated betwe foyer and the auditorium. The ge room is below the operator's box. Th torium is 80 ft. in width, and the projec 75 ft. to the screen. Ground floor modation is provided for 950, with exc ally large gangway provision, so as to the exit of the audience in comfort. Th five exit doors on the ground floor.

A special feature has been made orchestra platform. The screen "Surbrite," of size 21 ft. 9 in. by 18 f is covered by electrically operated c with special lighting effects. The balc the hall provides accommodation for comfort. The balcony has a span of terminating with boxes. The balcony tered from a crush hall 80 ft. by 26 ft. a large and central fireplace recess and a ceiling. The floor is laid with polishe block flooring. The seating throughc hall is arranged so as to give an uninte view of the screen from every seat.

Spaciousness is to be noted throughc scheme; under the balcony there height of 17 ft. The ventilation building is carried out by electric conveying the air through trunks arra the roof space, from the ceiling grids, system is such as to give a complete of air in the hall six times per hour heating is on the low-pressure hot-wat tem, and is provided with an electric and pump to give rapid acceleration circulation. The electric lighting theatre has many special points, s subdued reflected light, coloured tone and "dimmer" operation. The scheme throughout is effected with s designed silk-covered fittings in blue ar The main ceiling fittings are in the lighted Grecian urns, suspended fr ceiling with silken cords attached to t coloured handles of the urns. The light ing the pictures is so arranged that the ga and the access to all seats can be d seen, and the necessity for the attenc carry hand torches is obviated.

The general contractors were Messr Greenwood & Sons, Ltd., of Hull. specialist works were executed by the ing firms:—Balcony and roof ste Messrs. Arch. D. Dawney & Sons Battersea, S.W.11; general steelwork:

ting will be on the low pressure hot
em, provided with an electric motor and pump to give rapid acceleration to the system. Ladies' and gentlemen's lavatory accommodation is provided at each end of the building. Spaciousness will be in evidence throughout the entire scheme, and the underside of the balcony is being kept at a high level so as to entirely obviate any possibility of a depressing effect which is sometimes felt under the balconies of picture houses. Special features will be made of the electric lighting to the theatre, so as to obtain subdued electric lights, coloured tone effects with dimmer operation. The lighting during the showing of the pictures will be provided in such a manner that the gangways and access to all seats can be distinctly seen without any necessity for attendants to carry hand torches. The picture screen to be adopted for the theatre, in view of the width of the theatre, will be one of the largest in the country. Electrically operated curtains will cover the screen and special lighting effects will be provided in connection therewith. The skeleton construction of the building is of steel. The balcony, accommodating 700 people, is carried by a 20-ton main girder, 85 ft. span, without any intermediate supports in the auditorium, and by the other secondary girders and cantilevers. The roof construction is specially designed to assist in the rapid construction of the building, and is mainly carried by stanchions in the walls, enabling a large portion to be erected without waiting for the brickwork to be completed.

Messrs. Con. Greenwood & Sons, Ltd., De Grey-street, Hull, are the contractors, and following is a list of the sub-contractors:—Joinery, Messrs. John Taylor & Son, Saner-street, Hull; plumbing and glazing, Messrs. W. G. Padgett & Son, 89, Great Thornton-street, Hull; stonemasons, Messrs. The Hull Stone Co., Ltd., Lorraine-street, Hull; fibrous plaster, Mr. George Dobson, Saynor-road, Leeds; painting and decorating, Messrs. Lightowler & Son, 87, Beverley-road, Hull; slaters, Messrs. Dawber, Townsley & Co., Ltd., The Metropole, West-street, Hull; constructional steelwork, Messrs. Archibald D. Dawnay & Sons, Ltd., Steelworks-road, Battersea, S.W.11; heating, Messrs. Rosser & Russell, Ltd., 21, Aire-street, Leeds; ventilating, Messrs. Charles Raine & Sons, Ltd., 1, Cleveland-street, Hull; terra-cotta, Messrs. Alfred Whitehead, Ltd., Prudential-buildings, Park-row, Leeds; electric lift, Messrs. Gimson & Co., Ltd., Vulcan-road, Leicester; asphalte, The Northern Asphalte and Roofing Co., Hull. The contract for the organ, furnishing, and seating has not yet been let.

Messrs. Blackmore, Sykes & Co. are the architects.

The " Beau Nash " Picture House, Bath.

This Picture House was erected in 1920 in one of the main thoroughfares of the city, with a frontage of 58 ft. to the street. Owing to the exigencies of the site, the four main entrances and exits had to be arranged on this frontage only, the building being hemmed in by surrounding property on three sides.

The auditorium accommodates 532 and the balcony 212. The balcony is framed and constructed in concrete with two main steel girders with a span of 58 ft. The steelwork for this and the roof trusses was supplied by Messrs. Redpath, Brown & Co. The contractors were Messrs. J. Long & Sons, Ltd., builders, of Bath. The internal decorations were carried cut by the Stratford-on-Avon Applied Arts Company, and the architect was Mr. Alfred J. Taylor, F.S.Arc. Cost, £13,000.

The " Victory " Picture House, Bath.

This cinema is situated in a populous suburb of the city, and was erected in 1921. The site was a large one and there were no restrictions with regard to exits. The auditorium is 91 ft. by 49 ft., accommodating 594, with a balcony constructed in reinforced concrete on two concrete beams with a span of 49 ft. The balcony accommodates 192. The heating and ventilation was efficiently carried out by Messrs. G. N. Haden & Sons, Ltd., of Trowbridge; the reinforced concrete work by the Indented Bar Co., and the decorations by the Applied Arts Company, Stratford-on-Avon. Mr. Alfred J. Taylor, F.S.Arc., was the architect. The general contractors were Messrs. J. Long & Sons, Ltd., of Bath. Cost, £15,000.

" Rivoli " Picture Theatre, Worthing.

The architects of this cinema, which has a seating capacity of 1,900, are Messrs. Birdwood & Mitchell. Messrs. Ashford Builders, Ltd., are the general contractors. The electrical installation is by Messrs. E. C. Sparkes & Co.; fibrous plaster and decoration by Messrs. P. E. Marels & Co., Ltd.; electric light fittings, Messrs. Peyton & Peyton, Ltd.; marble work, Messrs. Fenning & Co., Ltd.; Plenum heating and ventilation, Messrs. G. Geffreys & Co., Ltd.; steel work, Messrs. Hawkins, Baxter & Co., Ltd.

LONDON AND ITS BRIDGES

MR. W. R. DAVIDGE, member of the Council of the London Society, recently lectured on this subject at the English-speaking Union's rooms at Charing Cross. Brigadier-General Sir Henry Maybury, Director-General of Roads, Ministry of Transport, presided.

With the aid of old picture maps, illustrated on the screen, the development of London from Roman times was demonstrated, beginning with the earliest in existence, that appearing in Geoffrey of Monmouth's Chronicles, and it was seen how London formed round the intersection of the old Roman roads and near the most suitable fords of the Thames and its tributaries; hence the names Old Ford, Ilford, Stratford, Romford, Brentford, &c. The lecturer mentioned the following interesting historical facts: The old West Bourne river was banked up to make the Serpentine. In 1561 the spire of St. Paul's Cathedral, which stood 100 ft. higher than the top of the present dome, was destroyed by lightning. London has had its Building Acts since 1189, and in 1212 it was decreed that there should be no projection on newly-built houses of more than 2 ft. 6 in., presumably in order not to interfere with passing knights. The fine was 40s. The prohibition and fine were still retained in Building Acts, showing the continuity of tradition.

After the Great Fire it was decreed that there should be three classes of buildings of varying sizes and heights, according to the zone. London Bridge was for centuries London's only bridge, with houses and later without houses. Old Westminster Bridge was the second (1750), and twice as much Portland stone was used in it as in the whole of St. Paul's Cathedral. In 1769 followed Old Blackfriars Bridge.

ARCHITECTS' AND SURVEYORS' ASSISTANTS' PROFESSIONAL UNION

A VERY successful smoking concert was held recently by the Architects' and Surveyors' Assistants' Professional Union at Carr's Restaurant, Strand. Amongst those present under the chairmanship of Mr. J. A. Gould (chairman of the London branch) were Messrs. H. H. Creasey, W. H. Beckett, C. McLachlan, A.R.I.B.A., P. W. Farmer, T. P. Bennett, F.R.I.B.A., J. Mitchell (General Secretary), W. S. Dalton (organiser of concert), C. Adamson, E. Sandford Freeman (Messrs. Crittalls, Ltd.).

Mr. Gould, in a brief speech, said the benevolent fund was an urgent matter, and owed its existence entirely to the work of Mr. Harvey Sayer.

Mr. McLachlan said they had great enthusiasm for the A.S.A.P.U., and it was recording excellent results. It was, however, necessary to increase their membership from the respective professions. He would make an appeal for their Benevolent Fund, which not only helped members in a sudden emergency, but assisted students in the pursuit of their studies.

It is proposed to hold a dance on January 29.

LAW REPORT

Architect's Action for Fees.

MR. RICHARD MOUNTFORD PIGOTT, A.R.I.B.A., architect, practising at 35, Bedford-row, W.C., brought an action recently in the King's Bench Division, before Mr. Justice Talbot, against the Wandsworth Borough Council to recover £1,270, the balance of fees he alleged to be due to him in connection with the housing scheme of the Council which was commenced in the year 1920. The defence was a denial of liability.

Mr. Barrington Ward, K.C., for the plaintiff, said the question raised was the construction of a contract, a Government Department having instructed payments to be made on one basis and the Council on another. The figures were not in dispute, assuming that the basis contended for by the plaintiff was the right one. The plaintiff in 1919 got into touch with the defendants, who had three separate and distinct housing schemes for the district of Wandsworth, and the plaintiff was appointed to the first of the three schemes—the Magdalen Park scheme. The defendants by their defence alleged that all the three estates were part of one building scheme for housing purposes, but they were all three distinct and separate. The one the plaintiff was to carry out was an estate where the Council bought the houses completed, the second and third were building in the ordinary contract way. In August, 1919, the plaintiff was appointed as architect under the terms of the Royal Institute of British Architects' Housing scale. Then a memorandum known as No. 4 came out from the Ministry of Health, and the plaintiff was asked if he would make his fees in accordance with that, and in the result the memorandum was incorporated in the contract. Plaintiff then proceeded with the work and he appointed and paid his own clerk of works. The plaintiff's case was that the only scheme which the plaintiff was connected with was the Magdalen Estate, but the Council were instructed by the Ministry of Health to pool the fees of the three architects of the three schemes, so that the remuneration the plaintiff got for doing more work would be reduced.

Mr. Pigott gave evidence and said when he was appointed as the architect for the Magdalen scheme the other two schemes had not been decided upon.

Mr. W. R. Davidge, F.R.I.B.A., F.S.I., gave evidence to the effect that he was commissioner for the London Area for housing at the Ministry of Health, and that there were three separate schemes for Wandsworth—the Magdalen Estate, the Watney Estate, and the Furzedown Estate, and each was distinct. The architect's work on each of the three was similar; but the basis of each scheme was different.

Mr. Wingate Saul, K.C., for the defendants, contended that under the Memorandum No. 4, although several architects could be engaged on the work of a housing scheme, their fees were to be pooled on the basis of 5 per cent. on the first 12 houses, 2½ per cent. on the next 60, and 1½ per cent. on the remainder of the contract. That was irrespective of the number of architects engaged, and was to be based on the total number of houses in the three schemes.

Mr. Justice Talbot, in giving judgment, said that Mr. Pigott was retained for the building of 376 houses, and although the Ministry of Health suggested that the maximum should be 250, it was perfectly plain he was retained to supervise the building of the larger number of houses, and on the terms of the contract. He did not think that the proper way to fix the remuneration was that contended for by the defendants. The word "Scheme" referred to in the General Housing Memorandum No. 4, in his opinion, could not be interpreted in the broad sense as used in the Housing Act of 1919, and must be construed as referring to this particular scheme and not treating the three schemes the Council had in hand as one scheme. He did not think that was the true construction of the document, and he accordingly gave judgment for the plaintiff, Mr. Pigott, for £1,270 and the costs of the action.

[It should be pointed out that, although the action had to be taken against the Wandsworth Borough Council, they were not in any way responsible for withholding the balance of fees due, and, on the contrary, they had offered £1,100 after the first refusal of the Ministry to pass £1,270, the balance claimed.

The judgment given is a very important one, as there are probably other architects who are in a similar position.]

THE SURVEYORS' INSTITUTION

SIR EDWIN SAVILL, O.B.E. (President), in his opening address before The Surveyors' Institution, last Monday, said in the course of his remarks that some idea of the problems which faced a surveyor might be gathered from the syllabus of their examinations, in which it would be found that an attempt was made to divide the subjects under four main heads, viz., land agency, valuation, building and quantities, and mining.

To a candidate who had passed all the examinations which, under these four categories, comprised no less than forty-three subjects, it was a little disappointing to find that, with the qualifications which he had so arduously obtained, he was in competition with others having no qualifications at all. There was nothing to prevent anyone calling himself a surveyor; he was merely debarred from calling himself a chartered surveyor or using the letters F.S.I., denoting Fellow of The Surveyors' Institution, or P.A.S.I., Professional Associate.

There was, perhaps, no profession which touched at so many points the interests of the public, both individual and collective, as that of the surveyor. The health of both town and country dwellers depended largely on their scientific knowledge of and regard for sanitation, lay-out, sewage disposal, water supply, and management of house property. Indeed, attention to these matters by well-qualified persons had been responsible for a reduction in the death rate to a degree almost equal to that attributable to medical knowledge and research. Upon their careful and experienced management of country estates the economic production of home-grown food and timber largely depended. The good relationship between owners and occupiers of all classes of property also depended to a great extent on the tact, capacity and foresight of the agent in charge; and, also, the financial success or otherwise of the many and various transactions to which both urban and rural property were subject, and on which the well-being of both owners and occupiers so largely hung. Those of them who had had an opportunity of seeing the difference between an estate, whether urban or rural, managed by a qualified person and one managed by an unqualified person would have no hesitation in saying that the happiness and welfare of millions of people depended to a large extent upon the qualifications which they were at such pains to acquire.

Economic building, with which the possibility of letting houses and other premises at reasonable rents was intimately connected, depended to a large extent on the surveyor in respect of accurate and readily understood quantities, experienced supervision of the work in course of erection, and care and knowledge in dealing with builders' accounts on completion.

Surveyors for the last fifty-five years had been doing their best to improve their efficiency by careful and arduous study, with the object of safeguarding the interests of the public and promoting the general interests of the profession. It was for these particular purposes that their fathers formed the Institution, and he thought the time had now come when the vast efforts that they had made should be recognised, and that it should not be possible for men who had no recognised qualifications to compete with those who had spent years of their lives and considerable sums of the endeavour to render themselves out the public and professional du were likely to fall upon them.

In 1922 he was appointed chairman Committee of The Surveyors' Insti Auctioneers' Institute, and the Lan Society, for the purpose of preparing the registration of those practising in three professions. The Bill had carefully drafted under the best a as was usual in such cases, it protecte who, whether tinker, tailor, cowboy were practising or carrying out work they in the three societies specially They would all have the right to regist examination, so that no one who earning his living by work similar would suffer in the smallest degree. after the Bill became an Act, howev would be able to register who had no by the passing of an examination ap a board representative of the profess the Government departments concern would in no way be compelled to join promoting societies. To him there a be no hardship in this. They were that all those who were now practisi continue to practise, but that in t others who intended to practise sh render themselves qualified to do so.

One would have thought that such would have met with the hearty ap kindred professions and of others wh the present position. He was sorry t was not so. The Bill was meeting siderable opposition, the most strenuo from an unexpected source, namely, profession. This was the more di understand as special provision was m Bill to allow members of the legal p architects, engineers, and other pr men possessing recognised qualifica continue to carry out any duties wh had at present the right to engage in that right being removed or restricte proposals contained in the Bill.

A Bill like theirs could be succes if it were made popular by reasoned and propaganda. It was in the in the public that the Bill should be and as their President, he asked e of the 6,000 members of the Insti do their utmost to bring its fairnes advantages before the public and be Members of Parliament (they covered country), and to use all their weigh suading those with whom they had in help it on in every possible way. It hoped that the Government departm whom they mostly came in contact w them their support. They recogn legislation was not easy to secure unde conditions, and some considerable ti possibly elapse before their aims wer The time, however, must largely dep the profession itself, and the manner its members were able to influence t to understand how intimately their were concerned.

AUCTIONEERS AN REGISTRATION

The Incorporated Society of Auctio Landed Property Agents recently had cation for incorporation without the word "Limited" granted.

Sir R. Woodman Burbidge is Presid Society, and it was until a short t known as the National Society o Property Practitioners, formed in 19 purpose of opposing the proposed R Bill affecting auctioneers and survey organisation has, we understand, a co membership, and its council is cor practitioners under the chairmansh E. K. House (Messrs. William White Secretary is Mr. Methuen A. Fh the office is at 42, Finsbury-square.

d to give questions and answers but cannot sibility for contributed replies, especially on

peal to our correspondents to submit their per of a size easily filed, and written as sible, or better still, in typescript?—ED.

Hollow Walls.

a house recently built there has been f damp working through at fairly ervals. The walls are in cavity work, hell being in 2 in. bricks and the inner y 3 in. common bricks. It looks as s of damp may occur where the wall been built in, though there are whole rows that appear all right. The ties a very usual twisted galvanised iron Can any of your readers suggest a ne phenomenon, which is quite beyond

"CAVITY."

Cinder Tracks.

Y TO "SPRINT," OCTOBER 31.]

cinder track should consist, first, oundation, composed of 6 in. of broken imilar material; second, a drainage n. of coarse clinkers, and then succeed- of finer clinkers graded from 1 in. n to ¼ in. do.; with a final dressing uff, composed of two parts ashes to of flue dust. The track should then vith a light roller to produce an even, surface, after which the heavy roller pplied to finally consolidate. I trust be sufficient information for your dent.

"ROAD-MAKER."

Communal Laundries.

PLY TO "SUDS," OCTOBER 31.]

here are several housing schemes in . area where communal laundries are and much appreciated by the tenants. tter of organisation to prevent friction ite periods in each week for the indi- nants should be allotted and sufficient vided to ensure that the roll can be ach week, not forgetting vacant time laundry can be cleaned out.

"CITIZEN."

Filter Beds.

Y TO "SANITAS," OCTOBER 31.]

our correspondent will find a great ent in his experience if he adopts destructor clinkers for the material r bed. There is far less fouling with rial than with ordinary coke breeze, val, though necessary at intervals, is a very much less frequent need.

"SEPTIC"

ewage Contaminated Water.

"YOUNG BUILDER," OCTOBER 31.]

ithout attempting to give a legal n the point raised by your corres- I should express the opinion that t ground for compensation from the rities, if the contamination of the e proved to be due to a fault in the er. The suggestion that the sewage k along the branch drain is very r the filling round drains has of be lightly rammed to avoid fractur- pes, and is, consequently, the least d of the ground round about, and orous. It would be well to ask the rity for a test upon the suspected ewer, and it is only just to agree to t of such test if suspicion has been A very frequent point of fault is onnection with the sewer where it is ult to make an absolutely water- This brings one to another point. ral rule, a public sewage system ublic water supply, and if it is the case here that there is a public water supply, I should strongly advise your correspondent to avail himself of it. His well is far too close to soil drainage to be safe, and there are evils following the drinking of contaminated water that cannot be compensated for in terms of money. There will also always be the risk of faults occurring in his own drain, which is only 6 ft. away.

"HEALTH FIRST."

Zinc Gutters.

SIR,—I shall be glad if any of your readers could recommend some material that can be used for painting over zinc valley gutters over bay windows, the usual small perforation having taken place through the wet weather.

E. H. DASHWOOD.

Made Ground.

[REPLY TO "CONFIDENT."]

SIR,—Safe loads to be placed on earth are a matter of personal judgment, and should be settled by inspecting the soil on site. Good made ground would bear ½ to 1 ton per ft. super. Compact earth (vegetable soil being removed) 1½ to 2 tons per ft. super. The proportion of loading depends largely upon the configuration of the surface, and the position of the site, &c. Surface clay ought not to be built upon. The weight of the superstructure must be in accordance with the carrying power of the soil.

A. SOUTH.

Wire Bells.

[REPLY TO "OLD-FASHIONED, OCTOBER 24.]

SIR,—In reply to your correspondent, I consider that the best specification for wires for hanging bells is, one part pure tin to three or four of copper, and wires of Nos. 16 to 19 B.W.G. are suitable. The wires should be well stretched before hanging, as otherwise use will destroy the tension.

"LIVE WIRE."

Rendering Accounts.

[REPLY TO MESSRS. GARBUSIL, LTD., OCTOBER 31.]

SIR,—I am very pleased to amplify my letter upon the above subject. The omission of a specific percentage was intentional, and to emphasise the necessity of basing an estimate of establishment charges upon the actual figures of experience. In saying that this estimate would serve as a useful guide as to the good or bad organisation of the business, I still did not have in mind any arbitrary figure, but rather meant that the builder who found year by year from his own figures that the percentage he had to allow for such charges was decreasing in spite of the expansion of his business, could congratulate himself that things were going well. A progressive increase should, on the contrary, give him furiously to think as to what branch of his business was not functioning properly. Pressed for a figure by your correspondents, I should say that 6 per cent. is a good mean, and that 5 per cent. and under for any length of period would indicate a business run on economical lines, and 7½ per cent. and over one run on extravagant lines. I repeat however that the point of importance is the progression or degression of the individual case.

"ARCHITECT."

The Therm.

SIR,—It seems rather late in the day to ask the question, but I should be very interested to have the meaning and purpose of the "therm" explained in simple unofficial language.

"CONSUMER."

Brick Footings.

SIR,—I am proposing to build a block of flats in the London area upon a wide spread of reinforced concrete foundations, owing to the nature of the sub-soil. The L.B.A. demands brick footings under all walls, which in such a case as this are obviously not necessary. Can you inform me if the District Surveyor has power to exercise his discretion in a case like this, or, if not, if there is any relief?

"PROVINCIAL."

Covering Power of Enamel.

SIR,—Would you kindly inform me what area per gallon should be covered by a good quality enamel?

"DECORATOR."

Running Cost of Electric Lifts.

SIR,—I should be glad to know what would be the probable running cost in London of an electric passenger lift, with a travel of about 50 ft. and car for six people.

"STATISTIC."

BUILDING COMMITTEES

IT will be remembered that on October 11 the Minister of Health announced that in pursuance of undertakings given when the Housing (Financial Provisions) Act of 1924 was before the House of Commons, he had taken steps to appoint committees of the building industry and of the manufacturers and suppliers of building materials to advise and assist him in carrying out the scheme embodied in the Act, particularly as regards the development and co-ordination of the supply of labour and materials for house building.

The Building Industry Committee, whose primary function is to assist in the augmentation of the supply of skilled labour, is at present composed of representatives of employers and operatives, but representatives of the manufacturers and suppliers of building materials will be added when nominated by them. Two meetings of this committee have already taken place, the first on October 16 and the second on October 20. Meetings of various sub-committees have also been held in the meantime, including a meeting in Glasgow of the Scottish Advisory sub-committee whose representatives cordially associated themselves with the policy of the main committee.

The committee has issued a circular letter to local organisations of employers and operatives throughout Great Britain drawing attention to the proposals for securing the necessary increases in the skilled ranks of the building industry contained in the report upon the building industry by representatives of employers and operatives issued in April last, asking for the appointment of local joint apprenticeship committees throughout Great Britain in order to help in carrying out these proposals and urging the desirability of complete co-operation in all steps proposed to secure the desired end. Pending the formation of these local committees the building Industry Committee is considering the machinery which should be set up for carrying out the other recommendations made in the report.

The College of Estate Management.

The following is the programme of special lectures for the winter session 1924–5. All lectures commence 5.30 p.m. (Tuesdays):—1924: November 18, "Tithe Redemption," Mr. P. W. Millard, LL.B.; November 25, "Building Contracts," Mr. W. T. Creswell, Barrister-at-Law, Lic.R.I.B.A.; December 2, "Compulsory Acquisition of Land," Mr. E. W. Eason, F.S.I., F.A.I.; December 9 and 16, "Rating of Special Properties and Public Undertakings," Mr. C. Dalgliesh, F.S.I. 1925: January 6 and 13, "Some Forest Insect Problems," Dr. J. W. Munro, D.Sc.; January 20, "Management of Landed Estates," Mr. F. G. Burroughes; January 27, to be arranged; February 3, "Organisation of a Professional Office," Professor Lawrence R. Dicksee, M.Com., F.C.A.

THE BUILDING TRADE

ESTIMATING FOR SMALL BUILDERS

By J. H. BARNS, F.I.O.B.

HARDWOOD FOR JOINERY.

THE purchase of hardwood for joinery is even more complex than deal, as each variety has many qualities and methods of measurement.

MAHOGANY.

This is usually imported into this country in logs and sold either to the large merchants direct or to other timber dealers by public auction. The sales are usually advertised in *The Builder*. Mahogany is sold in the log at what is known as brokers' measure, which seems to consist of a rule by which 12 in. is charged as 10½ in., with an allowance for faults and defects, and this would mean in practice that about 25 per cent. less is charged for the wood by brokers' measure than for actual contents, so that it would pay a timber merchant to sell the mahogany at the same price per ft. super as he himself paid for it, if he were allowed to charge the actual contents of the log, instead of the usual brokers' measure. After the mahogany is cut and seasoned, it is then sold by board measure, by which the actual contents of the board are measured and charged. It is usual to mark the superficial area of each board on the board itself to facilitate checking.

HONDURAS MAHOGANY.

The price of this mahogany varies considerably with the qualities of the wood. In the log it would cost from 9d. to 2s. 6d. per ft. super as 1 in. If bought properly seasoned from a timber merchant it would cost from 1s. 6d. to 4s. per ft. super as 1 in., the price depending upon the width and length of the boards and the general quality, figure of the wood, and freedom from defects. An ordinary width of a board cut from a log is 18 in., and for this the lower price may be charged; but for greater widths up to 3 or 4 ft., higher prices are charged. If special boards are allowed to be selected from a log they may be charged at about 2d. per ft. extra.

½ in. mahogany, 1/– per ft. upwards.
¾ in. „ 1/3 „ „

Some of this wood is imported sawn to different widths and thicknesses, with a square edge and of an average length of about 10 ft., and about 6 in. to 18 in. wide. This of course saves considerable loss, which is incurred by straightening the board cut from the log and ripping off the sappy edges and defects. The price is correspondingly higher for prime wood and for second quality stuff the price is much lower.

CUBA MAHOGANY.

This is imported in small quantities and the price would be within the range of figures mentioned for Honduras, except for selected parcels, the price of which would depend on the amount of figure in the boards. In some instances of exceptionally finely figured boards they have fetched up to 26s. per ft. super as 1 in.

AFRICAN MAHOGANY.

This is usually imported from Cape Lopez, Lagos, Benin, Grand Lahou, and Grand Bassam, in logs, and is mostly of excellent quality. Cape Lopez wood usually arrives in comparatively short lengths, and is of light colour. Lagos and Benin woods are of long lengths (from 20 to 30 ft.) and great widths (24 in. to 42 in.), but are sometimes a little dark in colour. Some of the wood has a grain very much like cedar. The Grand Bassam wood as an average seems to be the best mahogany imported, both in length, width, colour, and general texture of the wood.

The price of African mahogany in the log would be from 9d. to 1s. 6d. per ft. super as 1 in., and if seasoned would fetch from 1s. 3d. to 2s. per ft. super as 1 in. Nicaraguan mahogany is imported in round logs often about 18 in. diameter. It is of light colour and the price is about equal to African mahogany, similar quality and size.

While it may be easy to distinguish between different samples of Honduras, African, or Cuba mahogany, one frequently meets with some African mahogany which it is almost impossible to distinguish from Honduras, and Honduras mahogany which it is almost impossible to distinguish from African or Cuba. Honduras mahogany has few of the lightning or "falling" shakes. These are not infrequently met with in African mahogany, and where they occur the board would readily split into pieces 2 ft. long, so much so that it is almost impossible to work it by machine, and the log is more or less useless, at any rate, for builders' purposes. A piece of nice even grain African or Honduras mahogany would machine almost as easily as deal, but not infrequently one meets with a piece of stuff which is woolly, and this considerably runs up the cost of working.

OAK.

Wainscot oak billets are imported from Austria and Czecho-slovakia, &c. If purchased in the billet, these are usually sold by calliper measure, by the customs fund measurer. The calliper is used to take the sizes of the log, which is measured at the widest part, and therefore by calliper measure you will be paying for 25 per cent. to 30 per cent. more timber than is actually in the billet; in other words, you are making 25 per cent. to 30 per cent. loss on measurement. This would also apply to some birch logs. Some of the highest grades of wainscot come from the Austrian districts. Prices from 2s. to 4s. per ft. super as 1 in.

JAPANESE OAK.

This is now imported sawn to different sizes as scantlings and graded either as plain (*i.e.*, straight grained) or figured. When cross cut, some of the cheaper qualities have a caney appearance on the end section. The quality is usually very good, and the price, which will depend upon the length, width, and general quality, is from 1s. 6d. to 2s. 6d. per ft. super as 1 in.

AMERICAN OAK.

As now imported, this is often of low grade, but for equal quality the price is about the same as Japanese. A cheap kind of sa imported in planks and called "W It has a strong reddish colour. Whe develops shakes and splits. The pr 8s. to 10s. per ft. cube.

TEAK.

This is usually imported from Rangoon, and Moulmein, and is sa ferent sizes and very carefully gra prime quality is usually perfectly defects. A fair average length for be 9 ft. For anything over this the considerably. The prices are from 2s. 6d. per ft. super as 1 in., for ordin and lengths.

In selecting teak for joinery it is to be careful to get the milder woo those of the B.B.T.C.L., as they ar more easily worked than some of brands, such as "Steel." No doub nary purposes the harder brands employed.

PRIME AMERICAN WHITEWO

1 in. thick by 8 in. and upwards per ft. super.
1 in. thick by 18 in. wide, 1s. 1d. pe
Other thicknesses at *pro rata* price
Planed whitewood same prices.

Maximum Cost of Housing.

ster of Health in a recent letter to Rural District Council (Warwick- tioning the completion of a scheme tion of 276 houses, states: "It is t in the administration of the scheme l are exercising a discrimination rd to the value of the houses or with a view to ensuring that certi- ssued only in respect of houses for classes and not in respect of houses here is a market without the grant . In this connection I am to state derable number of local authorities for purposes of administration a re of cost varying from £600 to maximum all, in cost (including lits) for houses for which they will y. The Minister would anticipate of the type contemplated by the e erected at amounts not in excess res, and while he appreciates that of a maximum figure to be adopted rpose must to some extent be y local conditions, and he is pre- ave a certain discretion to local n this point, it is considered that uld not be promised in any case t cost to the purchaser or owner- eeds £600."

NEW BUILDINGS IN LONDON

Holborn, New Premises.

Messrs. Constantine & Vernon, F. and A.R.I.B.A., inform us that they have no connection whatever with the scheme of Messrs. F. W. Woolworth & Co., at these premises.

Tooting.—"The Fox" public house at Tooting, S.W., is being partially reconstructed and extended by the owners, Messrs. Watney, Combe, Reid & Co., Ltd., of Westminster, S.W. The new building will be of three floors, and will be erected in brick. The front elevation will be carried out in best quality stock brick, whilst the roof, pitched, will be tiled. The window casements will be of wood. The floors will be of wood, whilst granolithic will also be used. The whole of internal woodwork, such as bars, counters, panelling, partitions, &c., will all be carried out in oak or mahogany. The plans have been prepared by Mr. M. T. Saunders, the owners' staff architect. The builders are Messrs. E. A. Roone & Co., Ltd., 7, Urswick-street, London, E.9.

Fenchurch-street.—A new block of buildings is being erected in Fenchurch-street, E.C., to provide accommodation for office purposes. The premises will be of six floors with basement, and will have an ornamental terra-cotta front, supplied by Messrs. Shaw's Glazed Brick Co., Ltd., of Whitebirk, Darwen, and 12, Buckingham-street, Strand, London, W.C.2. Fireproof floors will be installed, whilst the roof will be covered with concrete and slates. The access to the upper floors will be reached by a main entrance and lobby, from which a lift will serve. The contractor is Mr. C. W. Ward, Fenchurch Buildings, E.C.3, whilst the steelwork has been supplied and erected by Messrs. Redpath, Brown & Co., Ltd., of 3, Laurence Pountney Hill, E.C.4. The architects are Messrs. Richardson & Gill, of 41, Russell-square, London, W.C.1. The consulting engineer is Mr. S. Bylander, 26, Old Burlington-street, London, W.1.

Threadneedle-street.—An extensive reconstruction is being carried out at the branch Post Office in Threadneedle-street, E.C. In order to cope with the large volume of business, an entirely new building is to be erected, to the designs of H.M. Office of Works, of Storey's Gate, S.W.1. The new building will be of seven stories, with fireproof floors, walls, &c., throughout. The front elevation will be of Portland stone, whilst the Mansard roof will be covered with green Cumberland slates. Two entrances will be provided—one leading to the Post Office and one to the upper floors which will be divided into offices. A complete system of heating, electric lighting, ventilating, telephone and pneumatic tubes will be installed. Lifts will also be provided, serving all floors. In the basement will be provision for books and stationery stores, strong room, heating chamber, fuel, &c. The general contractors are Messrs. Arthur Vigor, Ltd., of Knightsbridge, S.W.1., the principal sub-contractors being as follows: Steelwork, Messrs. H. Young & Sons, Ltd., Thorneycroft House, Smith-square, London, S.W.1; lifts, Messrs. Marryatt & Scott, Ltd., 57A, Hatton-garden, London, E.C.1; lift, Messrs. Aldous & Campbell, Ltd., 21, Lower Bland-street, London, S.E.1; marble and granite decorations, Messrs. Anselm, Odling & Sons, Ltd., 132, New North-road, London, N.1; masonry, Messrs. Frank Mortimer, Ltd., Samudas Wharf, Manchester-road, London, E.15; plumbing, Messrs. A. Gent & Sons, Dalston, E.

Soho-square.—New buildings are to be erected in Soho-square, W.1, for use as head offices for Messrs. Crosse & Blackwell, Ltd. The premises will be of considerable size, being eight stories in height, and large basements. The Mansard roof is to be covered with Cumberland slates, with asphalted and concreted tops. The building is being erected on a steel framework, and faced with Portland stone. The principal entrance is flanked by large ornamental windows, carried out in bronze, and lined with marble. The roofs will be concrete, reinforced on the "Truscon" system. All the windows will be of the steel casement type. Lifts will serve all floors, whilst electric light and power installations, heating and ventilating systems will be provided. The rear of the building will be extensively lined with white glazed bricks, and loading bays, &c., will be constructed. The general contractors are:—Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth-road, S.W., whilst the principal sub-contractors are as follows:—Steelwork, Messrs. Dorman, Long & Co., Ltd., 3, Central Buildings, Westminster, S.W.1, and Middlesbrough; stoneware, Messrs. The South Western Stone Co., 1, New-road, Battersea, S.W.8; sanitary fittings, Messrs. Adamsez, Ltd., 23, Old Queen-street, London, S.W.1; floor and wall tiling, Messrs. Carter & Co., Ltd., 29, Albert Embankment, London, S.E.11; rain water fittings and sanitary castings, Messrs. The Carron Co., Upper Thames-street, London, E.C.4; lift, Messrs. Express Lift Co., Ltd., Greycoat-street Works, Westminster, S.W.1; steel casements, Messrs. Crittall Manufacturing Co., Ltd., High Holborn, W.C., and Braintree, Essex; decorative plastering, Messrs. Carline Co., Acre-lane, Brixton, S.W.2; flooring, Messrs. Trussed Concrete Steel Co., Ltd., 22, Cranley-gardens, South Kensington, W.; asphalting, Messrs. The Ragusa Asphalte Co., Ltd., 25–27, Oxford-street, London, W.1; heating and ventilating, Messrs. J. H. Nicholl & Co., Ltd., 95, Southwark Bridge-road, S.E.1; electric light and power installation, Mr. F. H. Wheeler, 39, Victoria-street, Westminster, S.W.1. The architects are Messrs. Josephs, of 2, Paul's Bakehouse-court, Cannon-street, London, E.C.4.

Edgware, Middlesex.—The National Provincial Bank, Ltd., have bought a piece of land on the corner of Penshurst-gardens and Hale-lane upon which to build a new branch. Plans are being prepared under the direction of the chief architect, Mr. F. C. R. Palmer, F.R.I.B.A.

Finchley.—The Finchley Memorial Hospital in North Finchley, N.12, is to be extended by the erection on an adjoining site of buildings to comprise maternity wards, nurses' and domestic quarters. The additions will be built of brick with a slated or tiled roof, patent composition floors, central heating, electric lighting, &c. The hon. architect to the Hospital is Mr. Ernest A. Woodrow, F.R.I.B.A., of Ravenswood, High-road, Finchley, N.20.

Peckham Rye.—A new billiard hall and a row of shops are to be erected on the vacant site at the junction of Peckham Rye and Nunhead-crescent, London, S.E.15. A two-story building is proposed, constructed of brick, with ornamental artificial stone dressings. The shops will be on the ground floor, whilst the billiard hall will be on the first floor. The principal entrance will be at the apex of the site. The hall will be finished plain and distempered. The architects are Messrs. Dowton & Co., of 166, Rye-lane, London, S.E.15.

Empire Memorial Hostel for Sailors.

It was because of the urgent need for a home to house the 16,000 sailors from all parts of the world who sought shelter in the Port of London that it was decided to erect a lasting memorial hostel to the men—more especially those of the Merchant Service—who fell in the war. In 1917 the scheme was suggested by the Dowager Lady Dimsdale, who, in 1922, laid the foundation stone of the building which now stands opposite the Limehouse Town Hall. On Tuesday last week the hostel, which has been erected through the efforts of the Ladies' Guild, was formally opened by Princess Marie Louise. The house, for which Mr. Thomas Brammall Daniel, F.R.I.B.A., is the architect, contains 250 "cabins" simply furnished, giving private accommodation to each man; a spacious dining hall in which is erected a marble memorial tablet to the memory of those who died; recreation rooms, and a good library in which is hung a portrait of Seaman Drury, R.N.R., the first member of the Mercantile Marine to win the Victoria Cross.

LANDLORD'S FIXTURES

AN interesting point as to the repair of landlord's fixtures has been decided in the recent case, Boswell *v.* Crucible Steel Co., of America (*Weekly Notes*, November 1). By a lease made in May, 1912, certain premises to be used as a warehouse and offices were let by the plaintiff to the defendants for a term of ten years, this term having subsequently been extended for a further term of five years. By the terms of the lease, the defendants, the lessees, covenanted "to keep the inside of the premises, including all landlords' fixtures, in good decorative repair . . . and once in every three years to paint the outside of the window-frames and doors of the demised premises"; whilst the lessors covenanted to "repair, cleanse, maintain, and amend the demised premises with all necessary reparations, cleansing, and amendments, except such repairs as are hereby agreed to be executed by the lessees."

The premises fronted on two streets and practically the whole of the sides fronting these streets consisted of plate glass windows. In August, 1923, seven of these plate glass windows had been broken by some mischievous person outside, and the plaintiffs had given the defendants notice to repair them, contending that they were "landlord's fixture" within the above covenant. The defendants had refused, and in an action brought against them in the County Court the Judge had held the windows to be landlord's fixtures and had given judgment for the plaintiffs. A Divisional Court had affirmed this decision, but on appeal to the Court of Appeal these judgments were reversed. The Court of Appeal held that, as the windows formed part of the structure of the house, notwithstanding that they were affixed to the freehold, they were not "fixtures" in the legal sense and the lessee's covenant did not extend to them. The Court defined "landlord's fixtures" in a lease as meaning those things which, not being portions of the structure of the house itself, have been brought on to the premises and affixed thereto under such circumstances that they are not removable by the tenant. The case is at present only reported in the form of a head-note, but it gives a useful definition of the term "landlord's fixtures." In one of the well-known leading text-books, landlord's fixtures are defined as articles annexed by the tenant during the tenancy not falling within the exceptions of tenant's fixtures, "as well as all articles, whether of the excepted classes or not annexed at the commencement of the tenancy, notwithstanding they may have been annexed by a tenant and not removed during the previous tenancy." This, no doubt, means by a former tenant.

LAND FOR GREAT WEST ROAD

Sir Anker Simmons, K.B.E., Official Arbitrator, sitting at the Middlesex Guildhall, Westminster, heard a claim by Messrs. Dorey Brothers, Ltd., against the Middlesex County Council, regarding the Council's acquisition of the freehold interest in No. 81, Windmill-road (house, garden and sheds), and No. 83, Windmill-road (house and garden), at Brentford, for the purpose of the Great West-road.

Mr. S. G. Turner was counsel for the claimants, whilst the Hon. R. Stafford Cripps was counsel for the acquiring authority.

Mr. B. I'Anson Breach (of Messrs. Farebrother, Ellis & Co., auctioneers, surveyors and estate agents, of Fleet-street, E.C.), giving evidence for the claimants, valued No. 81 at £1,321, and No. 83 at £1,456.

On behalf of the County Council, Mr. Leslie R. Vigers (senior partner of Messrs. Vigers & Co., surveyors and estate agents, of Frederick's-place, Old Jewry, E.C.), valued No. 81 at £680, and No. 83 at £760.

The Official Arbitrator has since issued his award as follows: (1) The Acquiring Authority to pay to the claimants as compensation for their freehold interest the sum of £1,666; (2) the Acquiring Authority to pay the fees on this award; (3) all other costs to be paid by the respective parties.
